**Nagios XI** | How To Set Up A Nagios XI License Maintenance Status Check

## Purpose

This document describes how to set up a Nagios XI license maintenance status check. This is useful for admins who want to be notified when their Nagios XI license is about to expire. Renewing your Nagios XI license in a timely manner will ensure an interruption-free service.

## Target Audience

This document is intended for use by Nagios XI Administrators that wish to set up a license maintenance status check in Nagios XI.

## Requirements

In order for this plugin to work properly, you must use Nagios XI 5R1.0 or newer, and your server must be connected to the Internet. This check requires the a Nagios XI **admin user account** and the **Insecure Login Ticket** for that user account. In this guide the account being used is the `nagiosadmin` user account.

To get the Insecure Login Ticket for nagiosadmin user:

- Log into Nagios XI as the `nagiosadmin` user

- Allow insecure logins by going to Admin > System Settings > Backward Compatibility > Allow Insecure Logins = checked, and clicking on Update Settings

- In the top right corner click the `nagiosadmin` username

- You will be taken to the Account Information screen for the `nagiosadmin` user

- There is a section called **Insecure Login Settings**, this is what you need

  - Select the **Enable Insecure Login** check-box

  - Click on the **Generate new insecure ticket** button to create a ticket

  - Copy the ticket into your clipboard and paste it into a text editor so you can get it later when required

  - This example is using
    `8ALIJK2QLvuhgWaQJn3i9gI4i7nQ4L3bi49hNqnvYU6u8fkQWm95W78uuOkBPG2n`

## Nagios®

**www.nagios.com**

# Download, Install, And Test The check_license.sh Plugin

Download the following Nagios XI License Checker plugin and save it to your workstation:

https://assets.nagios.com/downloads/nagiosxi/scripts/check_license.sh

In the Nagios XI web interface navigate to **Admin** > **System Extensions** > **Manage Plugins**. Click the **Browse** button and locate the `check_license.sh` plugin you just downloaded. Then click the **Upload Plugin** button.

You will see a confirmation that the new plugin was installed successfully and `check_license.sh` should now appear in the list of available plugins on the Nagios XI server.

If you would like to view the usage (help menu) of this plugin, open a ssh (putty) session to your Nagios XI server, and execute the following command:

```
/usr/local/nagios/libexec/check_license.sh -h
```

After you verify that the plugin works from the command line (see the example in the help menu), you can proceed with setting up a command and a service check in Nagios XI.

```
[root@nagiosxi libexec]# ./check_license.sh -h

check_license.sh, ver.1.0, 01/31/2016 - Nagios XI License Checker

Usage: ./check_license.sh -H <ip address> -u <username> -t <ticket> -w <warning> -c <critical>

Requirements:
        *The Nagios XI server has to be connected to the Internet
        *The user has to be an 'Admin' user
        *The warning threshold must be greater than the critical threshold

Flags:
-H              IP address
-u              username
-t              ticket (API key)
-w              Warning threshold as int
-c              Critical threshold as int
-h|--help       Print help
-v              Show version

Example: ./check_license.sh -H 192.168.0.100 -u nagiosadmin -t k3i03nw -w 30 -c 15
```

# Define A Command

Navigate to **Configure** > **Core Config Manager** (CCM)

In the left pane expand **Commands** and then click

**>_ Commands**

Click the **Add New** button

The Command Management page will open. Populate the fields with the following values:

Command Name:

    **check_license**

Command Line:

    **$USER1$/check_license.sh -H $HOSTADDRESS$ -u $ARG1$ -t $ARG2$ -w $ARG3$ -c $ARG4$**

Command Type:

    **check command**

Active:

    **checked**

Click the **Save** button to create this new command.

# Add A Service

The next step is to create a new service definition for the Nagios XI `localhost` host object.

In the left pane expand **Monitoring** and then click **Services**.

Click the **Add New** button

Create the command with the following settings:

**Common Settings** tab

    Config Name:

        **`localhost`**

    Description:

        **Nagios XI License Check**

    **Click the Manage Hosts button**

        Select **`localhost`** in the left pane and click the **Add Selected >** button

        Click the Add A Service button

For this service we will use the generic-service template as it has a lot of the required directives already configured

Click the **Manage Templates** button

> Select `generic-service` in the left pane and click the **Add Selected >** button

> Click the **Close** button

Check command (drop down list)

> `check_license`

$ARG1$

> `nagiosadmin`

$ARG2$

> `8ALIJK2QLvuhgWaQJn3i9gI4i7nQ4L3bi49hNqnvYU6u8fkQWm95W78uuOkBPG2n`

$ARG3$

> `30`        (this is the warning threshold in days)

$ARG4$

> `15`        (this is the critical threshold in days)

Active:

> **Checked**

**Check Settings** tab

Check interval:

> `1440`

Retry interval:

> `20`

Max check attempts:

> `3`

Click the **Save** button and then click the **Apply Configuration** button at the bottom of the screen.

---

You may have noticed that the check interval is set to `1440`. There are `1440` minutes in a day, hence this setting causes the check to only run once a day, running any more frequently isn't really required.

## Service Management

## Service Management

**⚙ Common Settings**     **✔ Check Settings**     🔔 Alert Settings

**Initial state**

| Warning | Critical | Ok | Unreachable |
|---|---|---|---|

**Check interval**

| 1440 | min |
|---|---|

**Retry interval**

| 20 | min |
|---|---|

**Max check attempts**

| 3 | attempts |
|---|---|

# End Result

Now that the service has been created, navigate to **Home** > **Service Detail** and search for the service.

If the check has been configured correctly, you should see a result like the screenshot to the right.

# Hiding The Insecure Login Ticket

If you prefer to obfuscate the `ticket` so that it would not be visible under the CCM, you could use a macro. For example `$USER8$` could store the insecure login ticket and then in your service the `$ARG2$` field would reference the user macro `$USER8$`.

To learn more about how to implement user macros in Nagios XI, please refer to the following documentation:

Understanding The User Macros Component

# Finishing Up

This completes the documentation on how to setup a license maintenance status check for Nagios XI.
