

How to Monitor Microsoft SQL in Nagios XI 2024

Purpose

This document describes how to monitor Microsoft SQL in Nagios XI.

Terminology

MSSQL has several components that require configuration to allow Nagios XI to monitor it. The steps that are required differ depending on:

- Database engine is running as a **Named Instance**
 - Multiple instances of MSSQL can be installed on the same server but will be listening on separate network ports (normally dynamic)
 - The **SQL Server Browser** service will provide information about the instances installed (like the network port) when receiving requests on UDP port 1434
 - When using the MSSQL wizards, if you define an instance, you do not provide the port
- Database engine is configured to use a specific TCP port
 - The default instance of MSSQL commonly runs on TCP port 1433
- This or any other instance can be configured to listen on a specific port
 - When using the MSSQL wizards, if you define a port, you do not provide the instance name
- Database monitoring user account
 - You need to create a user account in the MSSQL instance to allow Nagios XI to connect
 - This account can use SQL authentication or Windows authentication with MSSQL
 - It is strongly recommended that you don't use the **sa** or administrator account for this purpose
- Database engine authentication method
 - SQL authentication
 - Is a local user account specific to the MSSQL instance
 - Windows authentication
 - Maps a Windows user account to an internal MSSQL user
- Windows firewall rules to allow inbound traffic
 - The MSSQL server will need firewall rules to allow the incoming network traffic

How to Monitor Microsoft SQL in Nagios XI 2024

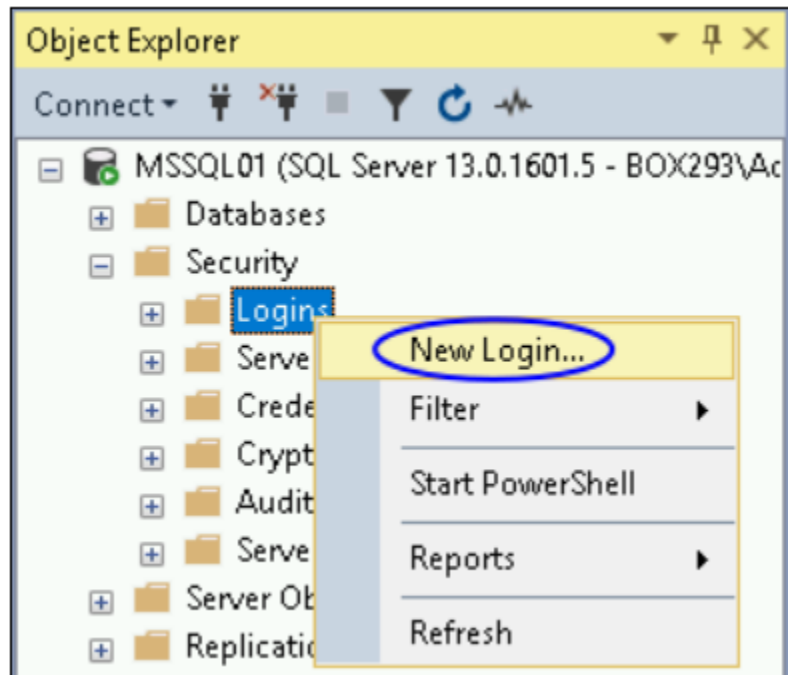

Create Monitoring User Account

The best practice for monitoring is to create a user account in the MSSQL instance that will be used by Nagios XI to connect. Even when using Windows Authentication, you will need to create an account in MSSQL that is linked to this account. It is advisable that your Windows or MSSQL account is not allowed to expire, otherwise this will cause monitoring issues when it eventually does expire.

1. On your MSSQL server, open **SQL Server Management Studio** and connect to your instance as a user with administrative rights.
2. Expand **Security** and select **Logins**.
3. Right click on **Logins** and select **New Login**
4. The **Login - New** window will appear.

Depending on your authentication method your choices will be slightly different:

- Windows Authentication
- SQL Authentication Windows Authentication

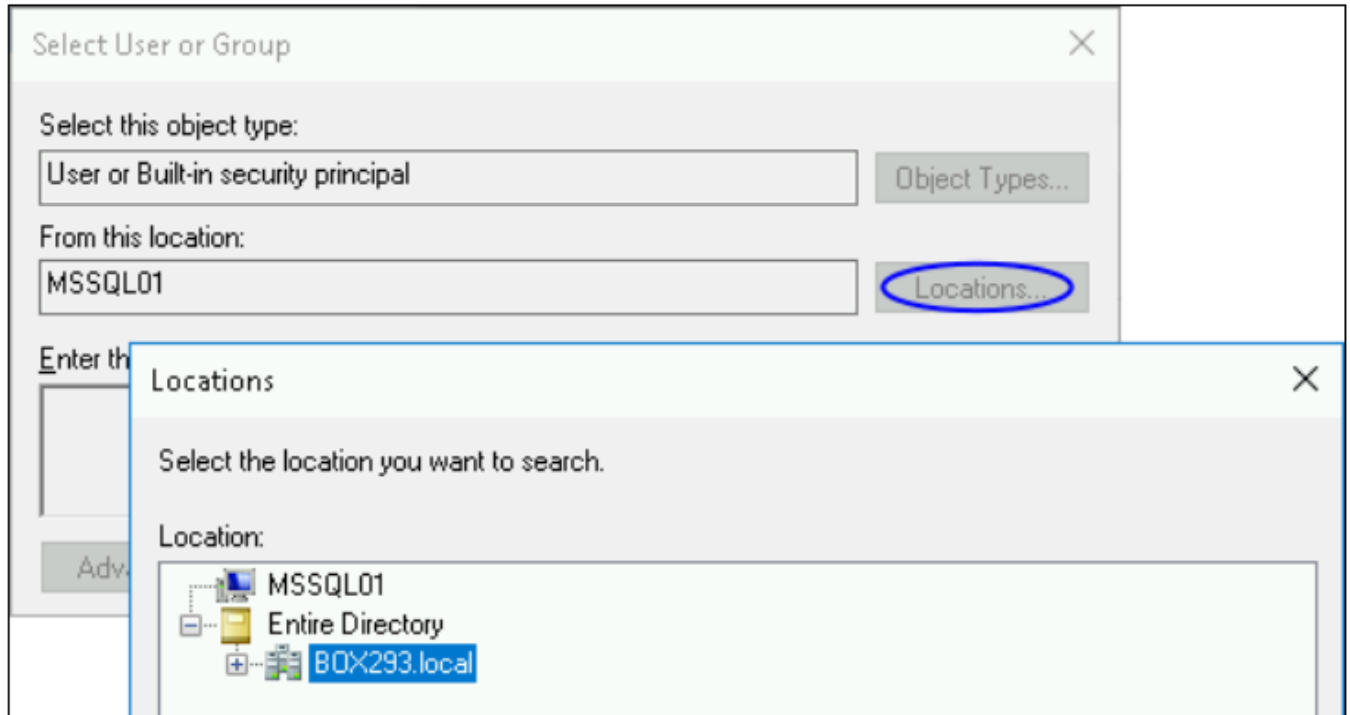

Windows Authentication

1. Select **Windows** authentication and then click the **Search** button.

How to Monitor Microsoft SQL in Nagios XI 2024

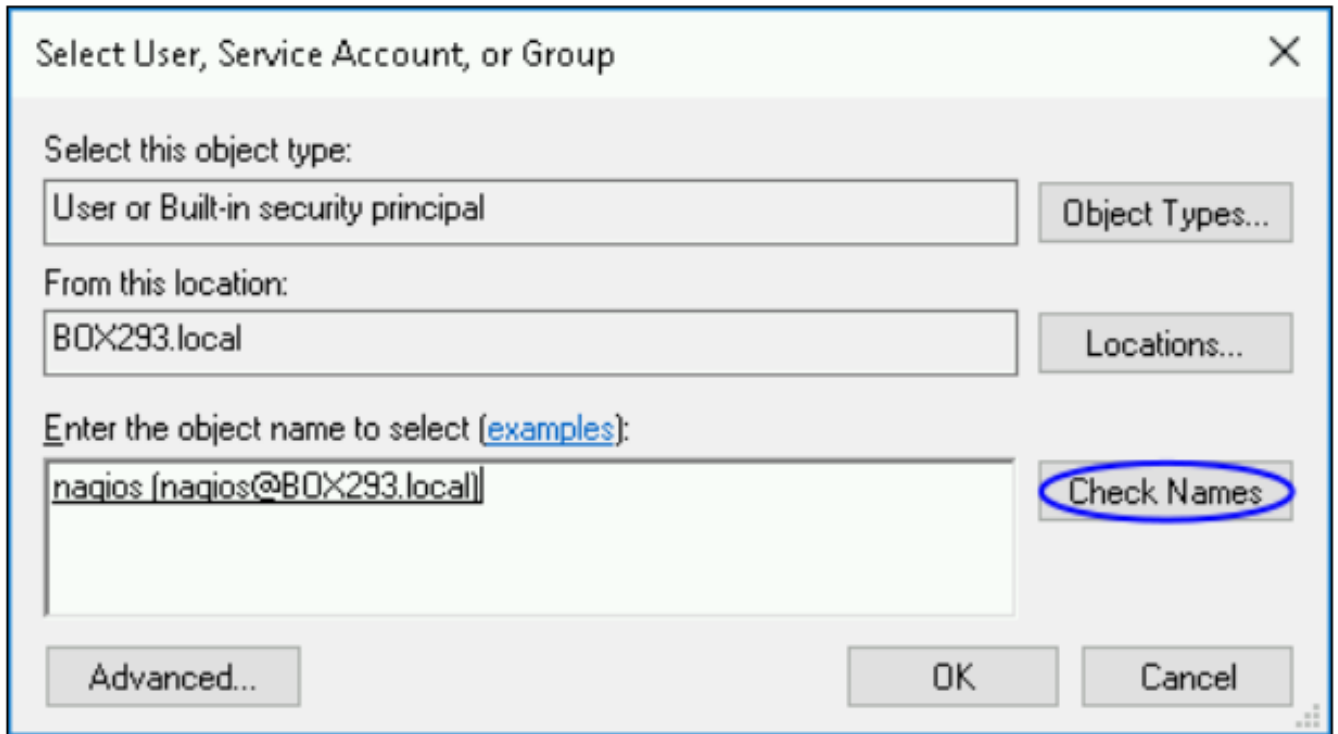

2. You will need to use the **Locations** button to define the scope of the Windows user account.

The default scope is the local server, if you want to use a domain account use the **Locations** button. In the screenshot you can see the `BOX293.local` domain was selected.

How to Monitor Microsoft SQL in Nagios XI 2024

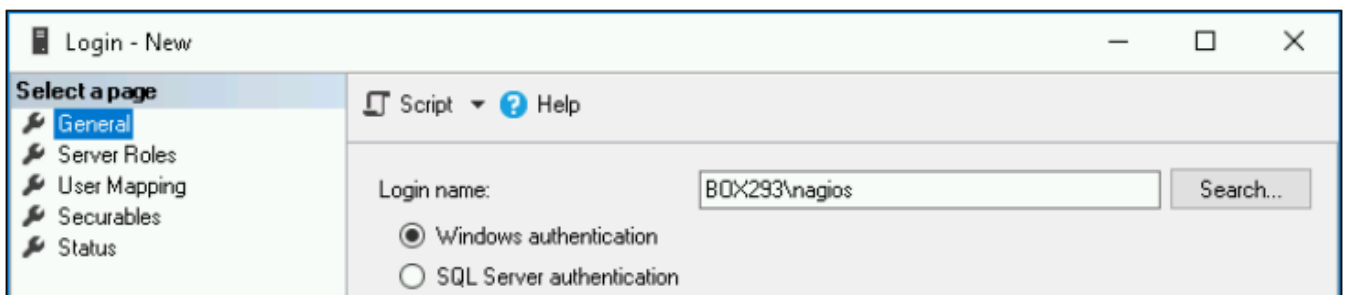

3. Type the name of the account and then click the **Check Names** button. Your user account should be found.

The screenshot shows a dialog box titled "Select User, Service Account, or Group". It has a close button (X) in the top right corner. The dialog contains the following fields and buttons:

- Select this object type:** A dropdown menu with "User or Built-in security principal" selected. To its right is a button labeled "Object Types...".
- From this location:** A text box containing "BOX293.local". To its right is a button labeled "Locations...".
- Enter the object name to select (examples):** A text box containing "nagios (nagios@BOX293.local)". To its right is a button labeled "Check Names", which is circled in blue.
- At the bottom left is a button labeled "Advanced...".
- At the bottom right are buttons labeled "OK" and "Cancel".

4. Click **OK** to select the account.
5. In the **New Login** screen, you can see the **Login name** field is now populated. All the required fields have been populated, click the **OK** button.

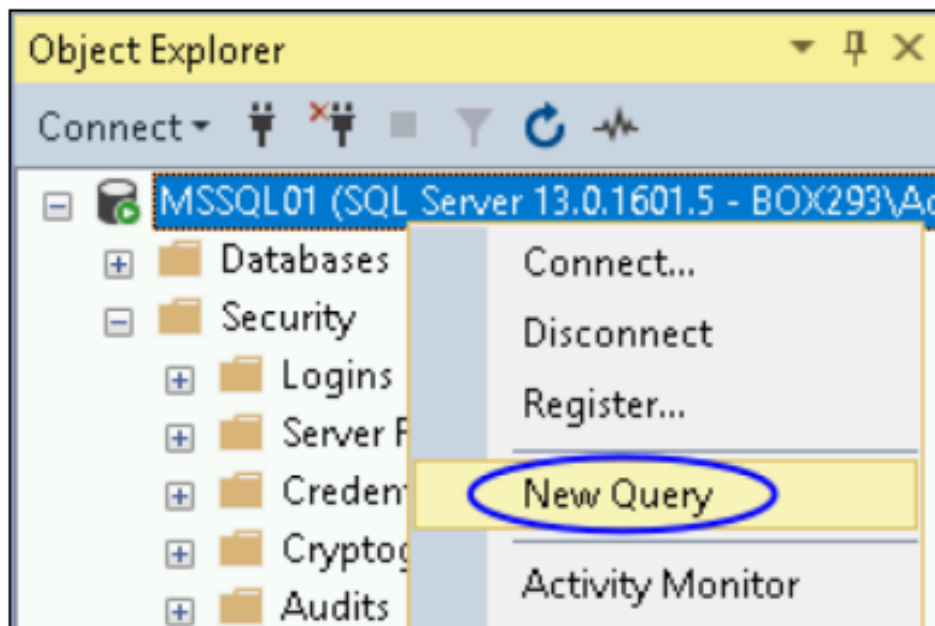

The screenshot shows the "Login - New" screen in Nagios XI. It has a sidebar on the left with a "Select a page" menu containing "General", "Server Roles", "User Mapping", "Securables", and "Status". The "General" page is selected. The main area contains the following fields and buttons:

- Script** and **Help** buttons.
- Login name:** A text box containing "BOX293\nagios". To its right is a button labeled "Search...".
- Authentication:** Two radio buttons: "Windows authentication" (selected) and "SQL Server authentication".

The **VIEW SERVER STATE** permission needs to be granted to the new user account.

How to Monitor Microsoft SQL in Nagios XI 2024

6. Right click the server at the top and select **New Query**.

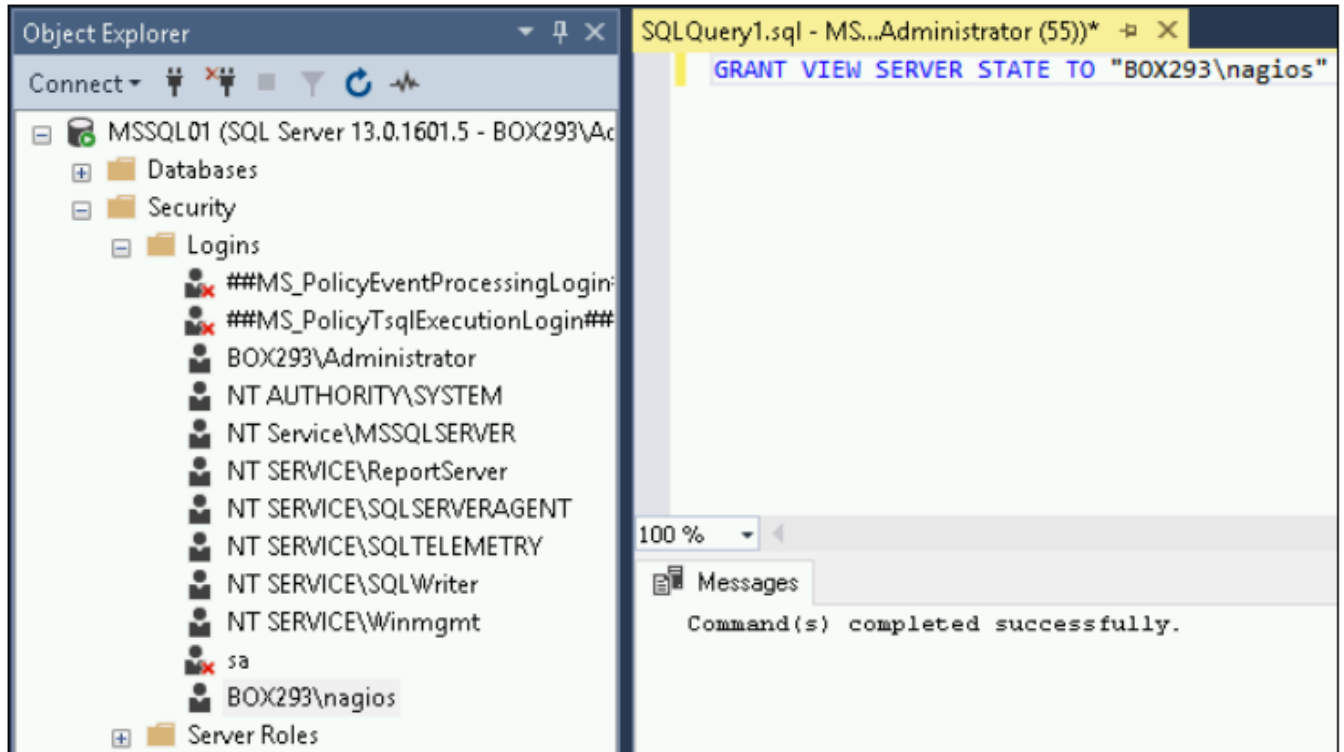

7. You will need to type the following in the query window:

```
GRANT VIEW SERVER STATE TO "<username>"
```

How to Monitor Microsoft SQL in Nagios XI 2024

In the screenshot you can see "BOX293\nagios" was provided, it needs to match the **Login** you can see in the left pane.

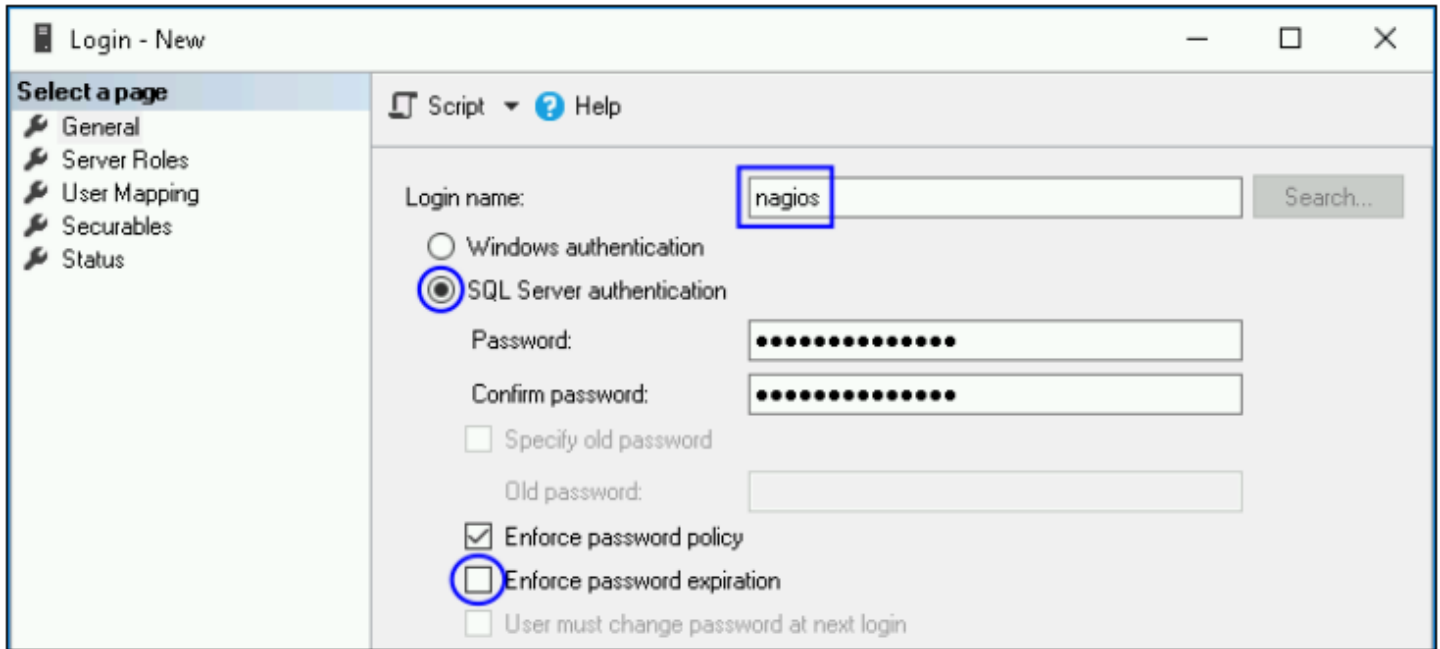

8. Press the **F5 key** on the keyboard to execute the query. You should receive the message "Command(s) completed successfully" in the messages window. You can now close the query window, when prompted to save changes, click **No**.

You can now proceed to the [Assign Monitoring Account](#) section of this document.

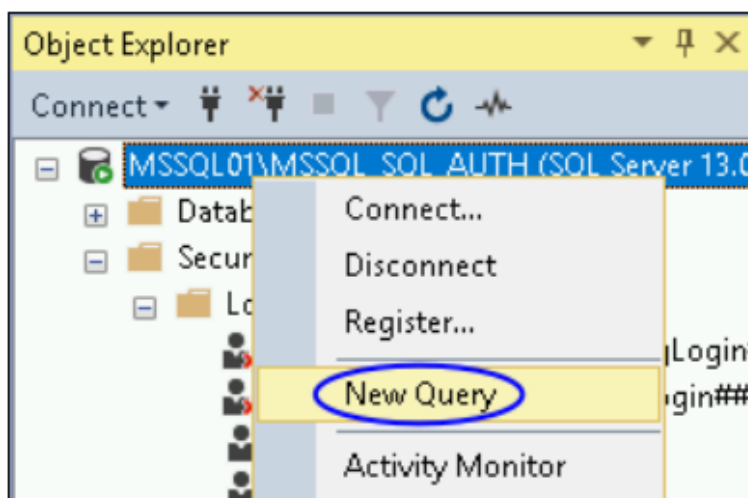

How to Monitor Microsoft SQL in Nagios XI 2024

SQL Authentication

The screenshot shows the 'Login - New' window in Nagios XI. The 'Login name' field is set to 'nagios'. The 'SQL Server authentication' radio button is selected. The 'Password' and 'Confirm password' fields are filled with dots. The 'Enforce password expiration' checkbox is unchecked. The 'Old password' field is empty. The 'Enforce password policy' checkbox is checked. The 'User must change password at next login' checkbox is unchecked.

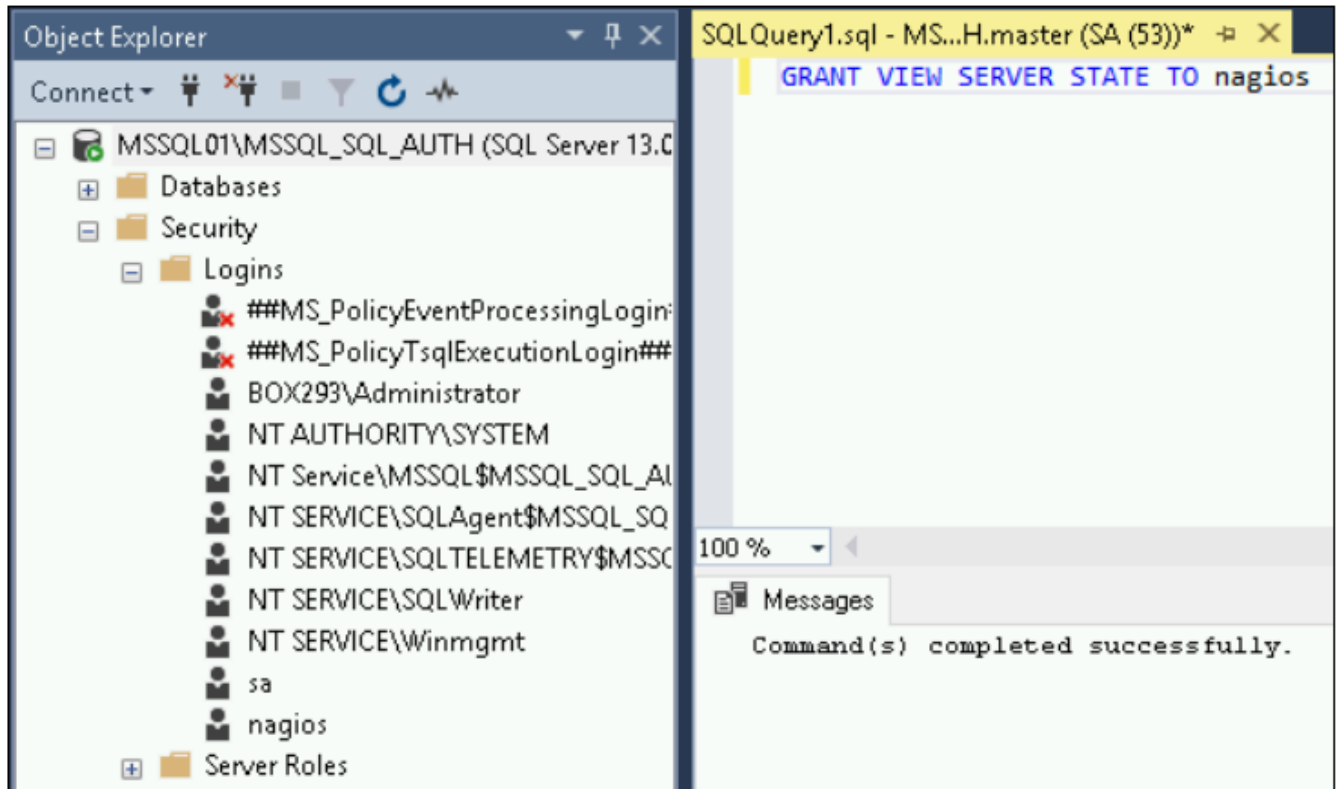

1. Provide a **Login name**.
2. Select **SQL Server authentication**.
3. Provide a **password**.
4. **Un-check** the **Enforce password expiration** checkbox.
5. Click **OK** to create the account.

How to Monitor Microsoft SQL in Nagios XI 2024

The **VIEW SERVER STATE** permission needs to be granted to the new user account.

6. Right click the server at the top and select **New Query**.

7. You will need to type the following in the query window:

```
GRANT VIEW SERVER STATE TO <username>
```

In the screenshot, you can see **nagios** was provided, it needs to match the **Login** you can see in the left pane.

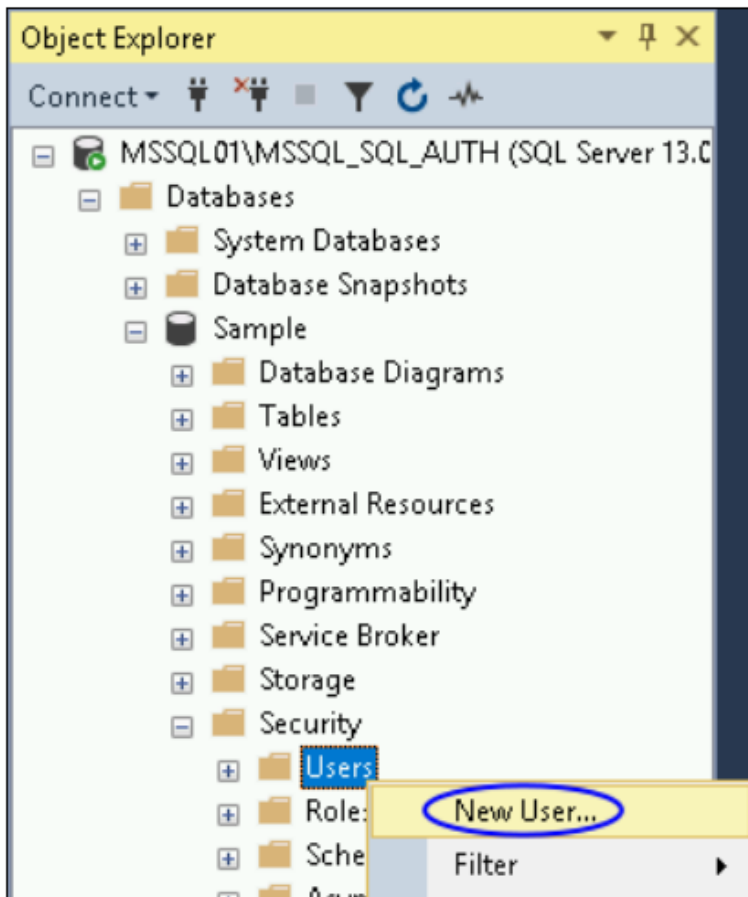

8. Press the **F5 key** on the keyboard to execute the query. You should receive the message "Command(s) completed successfully" in the messages window. You can now close the query window, when prompted to save changes, click **No**.

You can now proceed to the [Assign Monitoring Account](#) section of this document.

How to Monitor Microsoft SQL in Nagios XI 2024

Assign Monitoring Account

Now that a monitoring user account has been created it needs to be assigned to the databases you want to monitor.

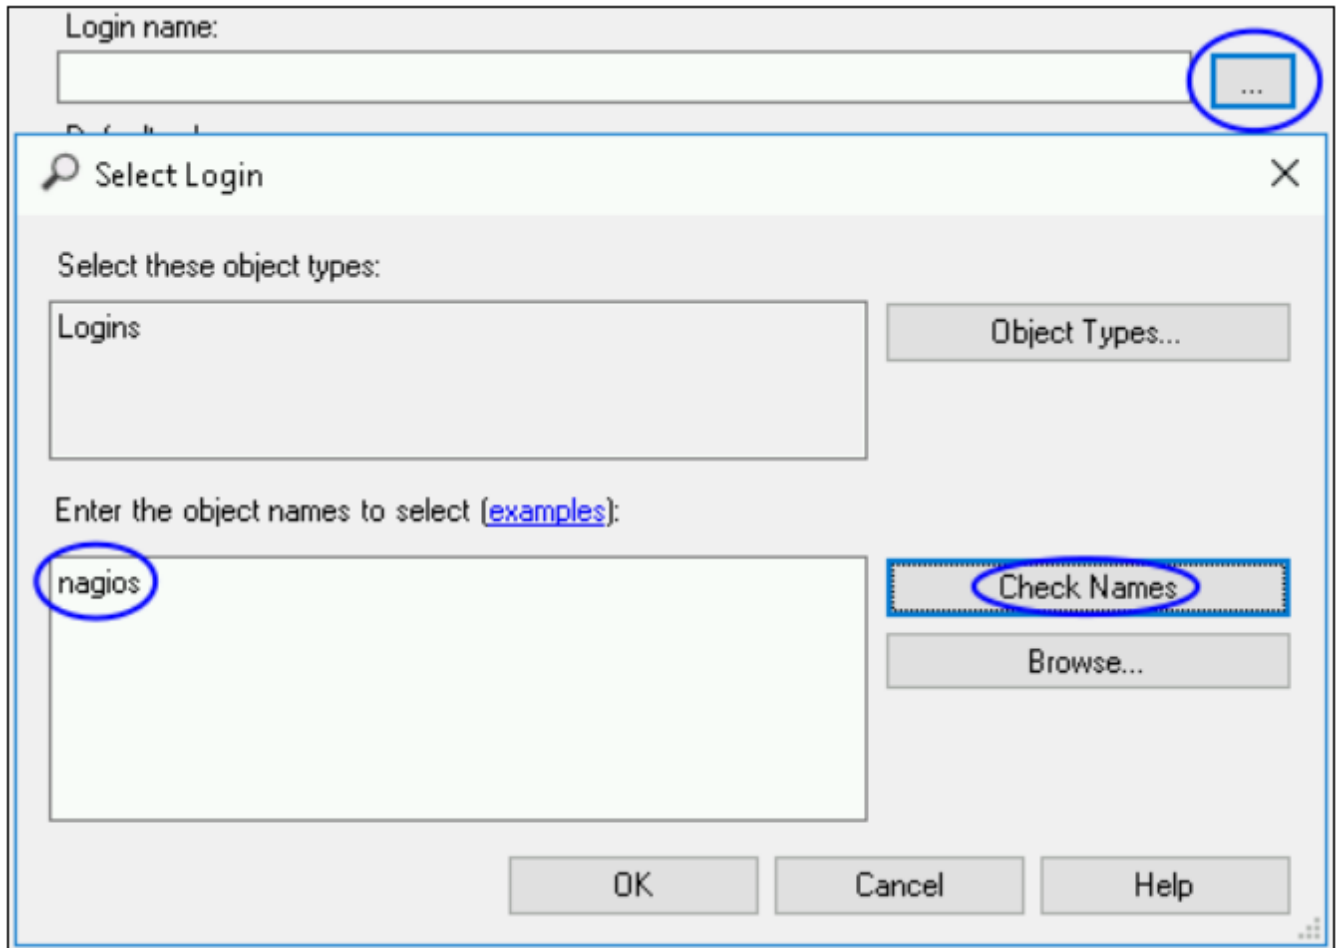

This example will use a database called Sample.

1. **Expand Databases > Sample > Security** and select **Users**.
2. Right click **Users** and select **New User**.

How to Monitor Microsoft SQL in Nagios XI 2024

The User type will be SQL user with login regardless of which authentication method you have chosen.

3. Provide a **Username**.
4. For the Login name click the ... button.
5. Type the name of the user and click the **Check Names** button.

How to Monitor Microsoft SQL in Nagios XI 2024

- You may be prompted to select the correct user, click the **OK** button once you have a valid name.

The screenshot shows a dialog box for creating a user. At the top, there is a dropdown menu labeled "User type:" with "SQL user with login" selected. Below this are three text input fields, each with a "..." button to its right. The first field is labeled "User name:" and contains the text "nagios". The second field is labeled "Login name:" and also contains "nagios". The third field is labeled "Default schema:" and is currently empty.

- Once you have populated these fields click the **OK** button.

You will now see the user appear in the list of users.

This completes the steps required for creating a user account for monitoring MSSQL.

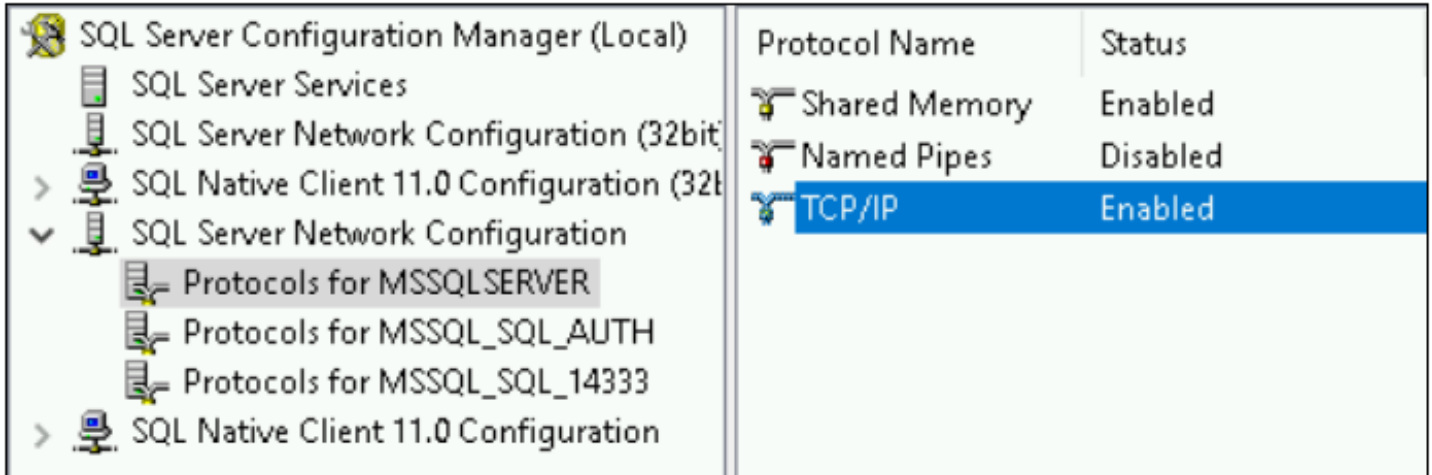

MSSQL Network Ports And Firewall Rules

- If your MSSQL server has the Windows firewall enabled, you will need to create firewall rules to allow inbound traffic from the Nagios XI server.
- If your Nagios XI server and MSSQL server are on separate subnets, the router(s) that connect these subnets may have firewall rules in place. These router(s) will also need firewall rules to allow traffic from the Nagios XI server to the MSSQL server.
- If you have multiple MSSQL instances on the same server then you will need to configure these instances to run on dedicated network ports.
- If you do not have the Windows firewall enabled, then this is not required. The SQL Browser service will inform the Nagios XI server which port to communicate on
- If your Nagios XI server and MSSQL server are on separate subnets, the router(s) connecting these subnets may have firewall rules in place. If this is the case, then the MSSQL instances will need to be configured to run on dedicated network ports.
- The same applies if you have SQL Express Edition.

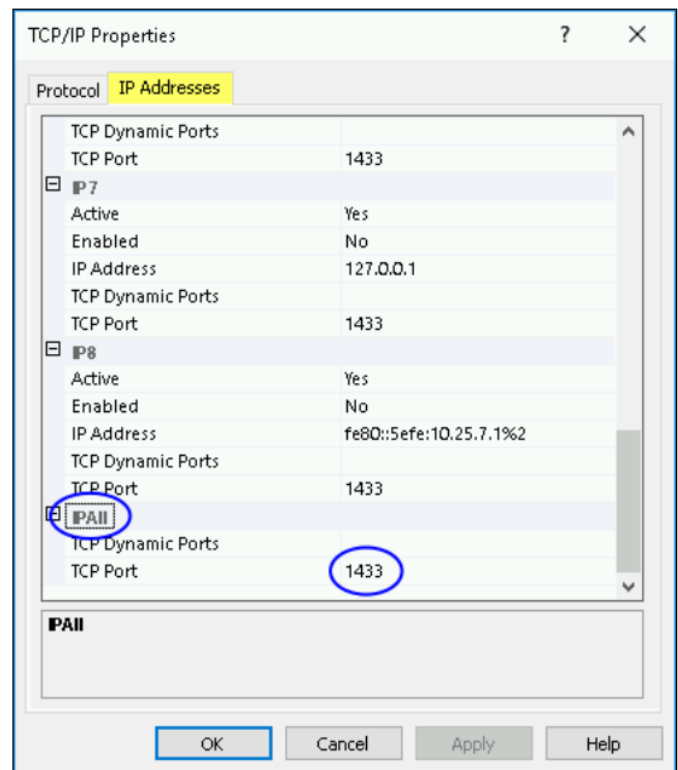

How to Monitor Microsoft SQL in Nagios XI 2024

Identify MSSQL Network Port

The first step is to identify the network port the MSSQL server is configured to run on. On your MSSQL server open the SQL Server Configuration Manager.

1. Select **SQL Server Network Configuration** and you will see a list of Protocols for the instances installed on your MSSQL server (this screenshot has three instances).
2. Double click on one of the instances and then double click on **TCP/IP**.

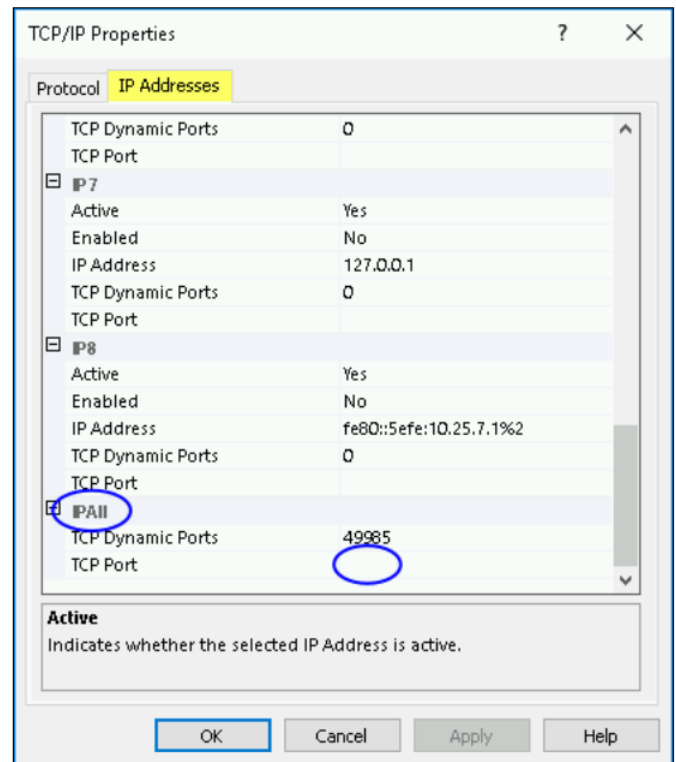

How to Monitor Microsoft SQL in Nagios XI 2024

3. Click the **IP Addresses** tab and scroll down to the **IPAll** section.
4. On the left screenshot you can see the port is **1433**.
5. On the right screenshot you can see there is no port, however the **Dynamic Port** field is populated.

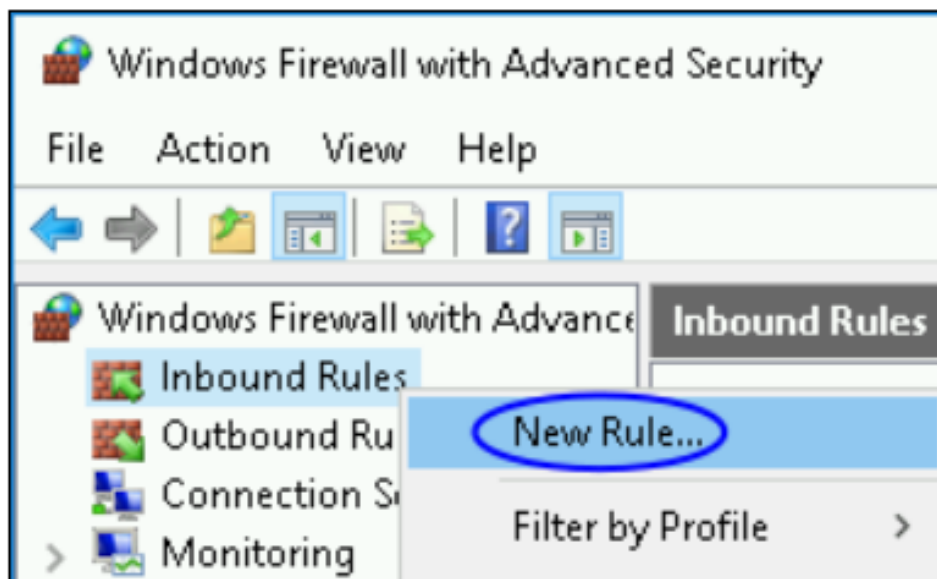

To change this to a fixed port:

- **Clear the TCP Dynamic Ports field**
- Type the port number you want to use in the TCP Port field
- Click **OK** and **restart** the SQL Server service (under SQL Server Services in the left pane)

Create Firewall Rule

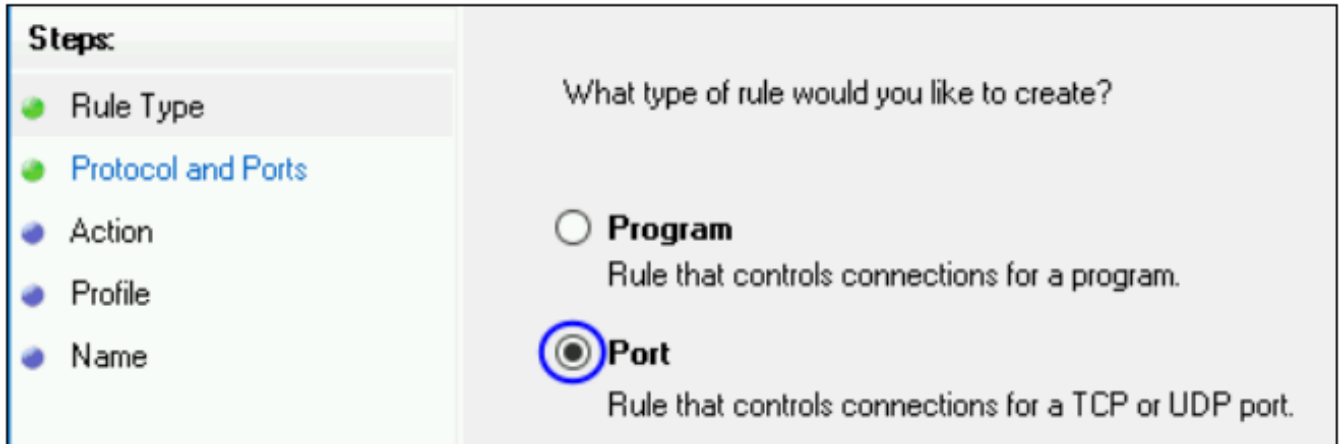

The next step is to create the network firewall rule. The following example will create a rule for TCP 1433.

1. Open **Windows Administrative Tools > Windows Firewall with Advanced Security**
2. In the left pane select **Inbound Rules**

How to Monitor Microsoft SQL in Nagios XI 2024

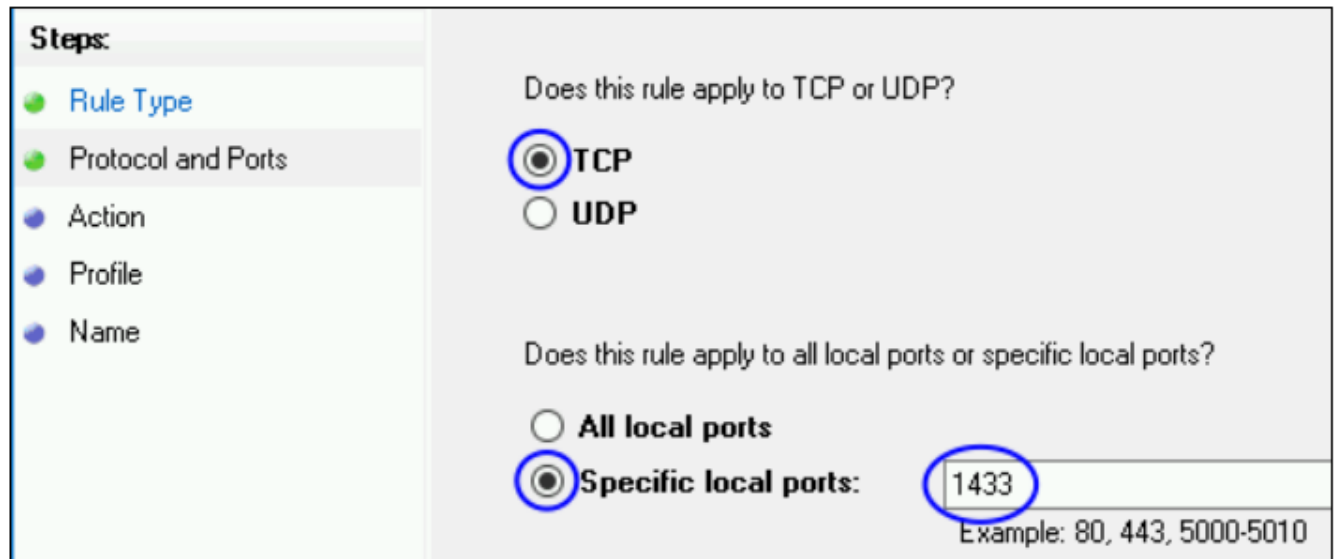

3. Right click **Inbound Rules** and select **New Rule**

The screenshot shows the 'New Rule' wizard in Nagios XI. On the left, a 'Steps' sidebar lists: Rule Type (selected), Protocol and Ports, Action, Profile, and Name. The main area asks 'What type of rule would you like to create?' with two radio button options: 'Program' (Rule that controls connections for a program.) and 'Port' (Rule that controls connections for a TCP or UDP port.). The 'Port' option is selected and circled in blue.

Select **Port**

4. Click **Next**

The screenshot shows the second step of the 'New Rule' wizard. The 'Steps' sidebar now highlights 'Protocol and Ports'. The main area asks 'Does this rule apply to TCP or UDP?' with radio buttons for 'TCP' (selected and circled in blue) and 'UDP'. Below, it asks 'Does this rule apply to all local ports or specific local ports?' with radio buttons for 'All local ports' and 'Specific local ports:' (selected and circled in blue). A text input field next to 'Specific local ports:' contains the number '1433' (circled in blue). Below the input field is the text 'Example: 80, 443, 5000-5010'.

5. Select **TCP**
6. Select **Specific local ports** and type the port number.
7. Click **Next**

How to Monitor Microsoft SQL in Nagios XI 2024

8. Select **Allow the connection**

The screenshot shows a configuration window with a sidebar on the left titled "Steps:" containing a list of steps: Rule Type, Protocol and Ports, Action, Profile, and Name. The "Action" step is currently selected. The main content area asks, "What action should be taken when a connection matches the specified conditions?" and features a radio button selection. The "Allow the connection" option is selected and highlighted with a blue circle. Below it, a note states: "This includes connections that are protected with IPsec as well as those are not."

9. Click **Next**

The screenshot shows the same configuration window, but now the "Profile" step is selected in the sidebar. The main content area asks, "When does this rule apply?" and lists three checked options: "Domain", "Private", and "Public". Each option has a brief description: "Domain" applies when a computer is connected to its corporate domain; "Private" applies when a computer is connected to a private network location, such as a home or work place; "Public" applies when a computer is connected to a public network location.

Make the sure **Profile selections** meet your requirements

10. Click **Next**

The screenshot shows the configuration window with the "Name" step selected in the sidebar. The main content area has a "Name:" label followed by a text input field containing "MSSQL TCP 1433", which is highlighted with a blue box. Below it is a "Description (optional):" label followed by an empty text input field.

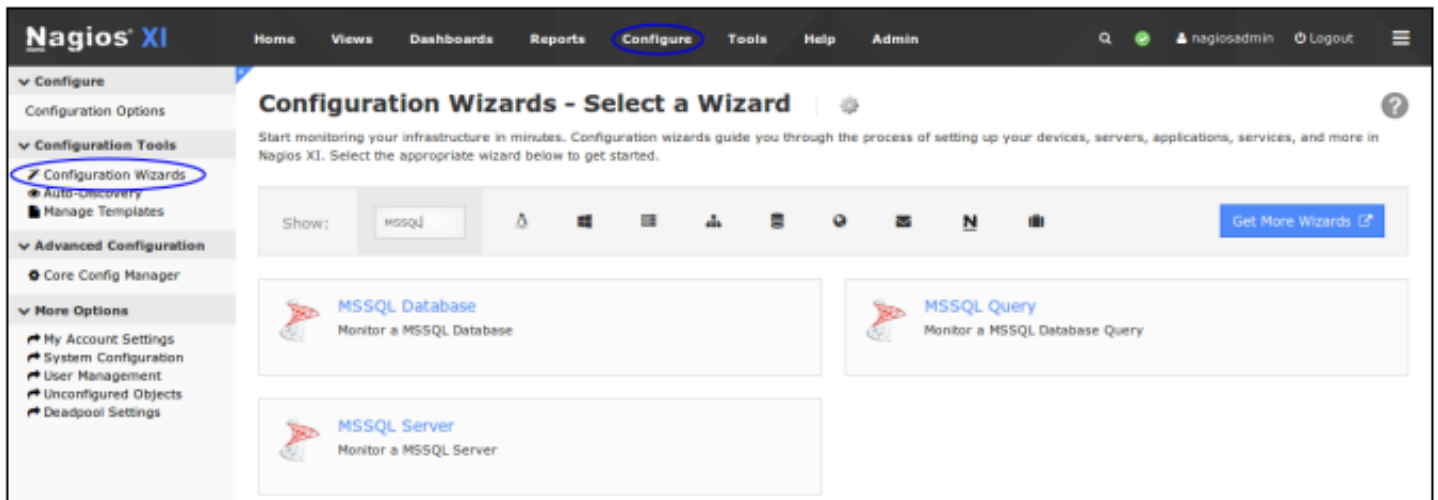

11. Provide a **Name** and optionally a description.

How to Monitor Microsoft SQL in Nagios XI 2024

12. Click **Finish**

Running The Configuration Wizards

This documentation will now explain the configuration wizards. In Nagios XI navigate to **Configure > Configuration Wizards** and select the **MSSQL wizard** of your choice. In the following screenshot, you can see how the search field allows you to quickly find a wizard.

Step 1 on each of the wizards has the same options, what you select here depends on your MSSQL instance configuration and firewall settings.

- **Address**
 - This is either the IP address or FQDN DNS record of the MSSQL server
 - Avoid using a flat name record like `mssql01`, use the FQDN like `mssql01.box293.local`
- **Instance**
 - Referencing the instance allows you to connect without defining a port number
 - To use the instance name instead of a port:
 - The SQL Browser service needs to be running on the MSSQL server
 - If you have the Windows firewall enabled:
 - A firewall rule must be created for UDP 1434 to allow the SQL Browser Service to work
 - Each MSSQL instance needs to be configured on a dedicated network port
 - A firewall rule must be created for each MSSQL instance running
- **Port**
 - Referencing the port allows you to connect without defining an instance name
 - If you have the Windows firewall enabled:

How to Monitor Microsoft SQL in Nagios XI 2024

- Each MSSQL instance needs to be configured on a dedicated network port
- A firewall rule must be created for each MSSQL instance running
- **Username**
 - This is the Windows username or SQL account required to connect, for example:
 - Windows authentication
 - BOX293\nagios
 - SQL authentication
 - nagios
- **Password**
 - The password for the username supplied
- **Database**
 - The Database and Query wizards require the name of the database you wish to monitor

MSSQL Server

Address:

Host Name:
The name you'd like to have associated with this MSSQL Database.

Instance:
Instance name of the MSSQL server.

Port:

Username:

Password:

Database:

Step 2 on each of the wizards will present a summary of the SQL Server details at the top of the page. Make sure the **Host Name** field has a value that easily identifies this MSSQL Server. Each of the wizards has different metrics that can be measured. The metrics available are clearly explained in the wizards and hence will not be covered here.

The warning and critical thresholds can be defined as per the Nagios Plugin Development Guidelines, detailed information on this can be found on the following page:

How to Monitor Microsoft SQL in Nagios XI 2024

<https://nagios-plugins.org/doc/guidelines.html#THRESHOLDFORMAT>

Once you've finished selecting all the items you wish to monitor click **Next** and then complete the wizard by choosing the required options in **Step 3 - Step 5**.

To finish up, click on **Finish** in the final step of the wizard. This will create new hosts and services and begin monitoring.

Once the wizard applies the configuration, click the **View status details** for link to see the new host and services that were created. Here are some examples from the different wizards:

MSSQL Database:

Host	Service	Status	Duration	Attempt	Last Check	Status Information
MSSQL.01	Sample MSSQL Active Transactions	Ok	2h 9m 31s	1/5	2017-08-03 13:29:44	OK: Active Transactions is 0.0
	Sample MSSQL Connection Time	Ok	2h 9m 2s	1/5	2017-08-03 13:30:13	OK: Time to connect was 0.0101470947266s
	Sample MSSQL Database Size	Ok	2h 38m 25s	1/5	2017-08-03 13:30:28	OK: Database size is 8192.0KB
	Sample MSSQL Log File Usage	Ok	2h 8m 37s	1/5	2017-08-03 13:30:38	OK: Log File Usage is 6.0%
	Sample MSSQL Log Flush Wait Time	Ok	2h 8m 5s	1/5	2017-08-03 13:31:09	OK: Log Flush Wait Time is 15.0ms
	Sample MSSQL Log Growths	Ok	2h 7m 37s	1/5	2017-08-03 13:31:38	OK: Log Growths is 0.0
	Sample MSSQL Log Shrinks	Ok	2h 7m 8s	1/5	2017-08-03 13:32:07	OK: Log Shrinks is 0.0
	Sample MSSQL Log Truncations	Ok	2h 6m 39s	1/5	2017-08-03 13:32:36	OK: Log Truncations is 0.0
	Sample MSSQL Transactions / Sec	Ok	2h 6m 18s	1/5	2017-08-03 13:32:57	OK: Transactions Per Second is 0.0133315450842/sec

MSSQL Query:

Host	Service	Status	Duration	Attempt	Last Check	Status Information
MSSQL.01	MSSQL Query - Test Query	Critical	2h 5m 10s	5/5	2017-08-03 13:32:24	CRITICAL: Query result 1470 was higher than query critical threshold 200.

How to Monitor Microsoft SQL in Nagios XI 2024

MSSQL Server:

Host	Service	Status	Duration	Attempt	Last Check	Status Information
MSSQL01	MSSQL Average Wait Time	Critical	2h 8m 0s	5/5	2017-08-03 13:35:48	CRITICAL: Average Wait Time (ms) is 234.0ms
	MSSQL Buffer Hit Ratio	Ok	2h 7m 46s	1/5	2017-08-03 13:37:23	OK: Buffer Cache Hit Ratio is 100.0%
	MSSQL Checkpoint Pages Per Sec	Ok	2h 6m 19s	1/5	2017-08-03 13:38:37	OK: Checkpoint Pages / Sec is 0.0/sec
	MSSQL Connection Time	Ok	2h 7m 10s	1/5	2017-08-03 13:37:57	OK: Time to connect was 0.0039529800415s
	MSSQL Database Pages	Critical	2h 6m 47s	5/5	2017-08-03 13:37:11	CRITICAL: Database pages are 3205.0
	MSSQL Deadlocks Per Sec	Ok	2h 5m 34s	1/5	2017-08-03 13:39:27	OK: Deadlocks / Sec is 0.0/sec
	MSSQL Lazy Writes Per Sec	Ok	2h 5m 9s	1/5	2017-08-03 13:39:55	OK: Lazy Writes / Sec is 0.0/sec
	MSSQL Lock Requests Per Sec	Ok	18m 44s	1/5	2017-08-03 13:36:20	OK: Lock Requests / Sec is 13.1795663062/sec
	MSSQL Lock Timeouts Per Sec	Ok	2h 4m 20s	1/5	2017-08-03 13:35:43	OK: Lock Timeouts / Sec is 0.0/sec
	MSSQL Lock Wait Times	Ok	2h 5m 1s	1/5	2017-08-03 13:40:03	OK: Lock Wait Time (ms) is 234.0ms
	MSSQL Lock Waits Per Sec	Ok	2h 3m 41s	1/5	2017-08-03 13:36:13	OK: Lockwaits / Sec is 0.0/sec
	MSSQL Page Looks Per Sec	Ok	16m 19s	1/5	2017-08-03 13:38:45	OK: Page Lookups Per Second is 3.48661685394
	MSSQL Page Reads Per Sec	Ok	2h 3m 8s	1/5	2017-08-03 13:36:56	OK: Page Reads / Sec is 0.0/sec

Troubleshooting Tips

If you experience problems with the services created by the wizards there are some simple troubleshooting steps you can follow which are related to the earlier sections in this documentation.

The first step would be to temporarily disable the Windows Firewall on the MSSQL server and see if the problem stops. If it does, then you know you need to add firewall rules and possibly configure the MSSQL instance to listen on a specific port.

There are KB articles that deal with specific issues with monitoring MSSQL in Nagios XI. You can review them here:

<https://support.nagios.com/kb/article/nagios-xi-mssql-query-wizard-invalid-characters-in-the-username.html>

<https://support.nagios.com/kb/article/nagios-xi-mssql-wizards-adaptive-server-connection-failed.htm>

Other problems may require further troubleshooting via our support forums or through customer support.
