

Purpose

This documentation provides you with a listing of the most common ports and protocols used in conjunction with Nagios XI.

Target Audience

This document is intended to provide Nagios Network Administrators with the port and protocol information that they need to properly configure servers for use with Nagios XI.

Overview

Important Notes

- While there are a set of basic default ports for Nagios XI, keep in mind that Nagios XI is highly configurable, and an administrator may use non-default ports should they so choose.
- There are thousands of community-provided Nagios plugins which may use any port to send or receive data. Administrators are advised to be aware of the port requirements in their environment.

Protocols

HTTP(s), ports 80 and 443	The Nagios XI product interfaces are web-based. Additionally, many of the Nagios agents are able to use HTTP to move data. SSL is not turned on out of the box.
SNMP, ports 161 and 162	SNMP is an integral part of network monitoring. Nagios XI will send requests to nodes on port 161 and receive results and traps on 162.
SSH, port 22	Nagios is built to run natively on supported Linux distributions. While nearly all administration can be done through the web interface, administrators may from time to time wish to log in.

FTP, port 21

Nagios XI gives you the option of moving a scheduled backup to a server on your network via FTP.

Default Ports Used by Common Nagios Plugins

check_nt (nscclient++)	12489
Email (SMTP)	25, 465, 587
MongoDB	27017, 27018
MSSQL	1433
MySQL	3306
NCPA	5693
NRPE	5666
NSCA	5667
OracleDB	1521
PostgreSQL	5432
Weblogic	9090, 7001
WMI	135, 445 / additional dynamically-assigned ports in 1024-1034 range

Finishing Up

This completes the documentation on ports and protocols in Nagios XI.
