

How to Use SNMP Traps with NXTI in Nagios XI 2024

Purpose

This document is intended for use by Nagios Administrators who would like to know how to use the Nagios XI SNMP Trap Interface (NXTI) to monitor and manage incoming SNMP Traps.

Overview

NXTI was introduced with Nagios XI 5.5 and is enabled with the Enterprise edition license of Nagios XI. If you do not have the Enterprise edition license you can still configure Nagios XI to accept SNMP traps; however, this is not covered here, please refer to the [Integrating SNMP Traps With Nagios XI](#) documentation.

NXTI serves as a web front-end to the `snmptrapd/snmpd` workflow configuration. Previously this was configured by manually editing configuration files (still the required method if you don't have the Enterprise edition license). NXTI additionally provides reporting of the traps received which are stored in a database. This functionality is exclusive to NXTI.

What Is an SNMP Trap?

The following is taken from the [Net-SNMP](#) website:

“A trap is a SNMP message sent from one application to another (which is typically on a remote host). Their purpose is merely to notify the other application that something has happened, has been noticed.”

An important point to stress with SNMP traps is that they are asynchronous events that can occur at any time. In Nagios XI this is what is called a **Passive** check/service. This means that they are not actively checked by Nagios XI on a regular schedule. Nagios XI is waiting for a SNMP Trap to be received from the remote device. A comparison between an active check and a passive check helps explain the difference between **Active** and **Passive** checks:

Scenario: A UPS device loses input power and is running on batteries.

- With an **Active** check, if Nagios XI was checking the device on a 5-minute interval, then it might be up to 5 minutes before Nagios XI is aware that the device is running on batteries.
- With a **Passive** check, the device immediately sends an SNMP Trap to Nagios XI when it is running on batteries

More detailed information on passive services can be found in our [How to Configure Passive Services with Nagios XI](#) documentation.

How to Use SNMP Traps with NXTI in Nagios XI 2024

SNMP v2 vs SNMP v3

SNMP traps can be received using v2 or v3 of the protocol. By default, the Nagios XI server will accept inbound SNMP v2 traps from any device. Security for accepting SNMP v2 traps is explained in our [Nagios XI - SNMP Trap Hardening](#) article.

Nagios XI needs to be configured before it can accept SNMP v3 traps, this is detailed in our [Nagios XI - SNMP Trap v3 Configuration](#) article.

NXTI Interface

To access NXTI navigate to **Admin > Monitoring Config > SNMP Trap Interface**.

The screenshot displays the 'SNMP Trap Interface' in Nagios XI. At the top right, a green checkmark indicates 'SNMPPTT is running'. Below the title, there are tabs for 'Received Traps' (selected), 'Defined Traps', and 'Advanced'. The main content area shows 'Showing records 0-0 of 0'. Below this is a search bar and navigation controls, including 'Page 0 of 0' and '5 Per Page'. A table header is visible with columns: 'Timestamp', 'Event Name', 'OID', 'Trap Origin IP', 'Category', 'Severity', and 'Actions'. A message below the table reads: 'No received traps! If you already have the example trap definition, click the "Test Example Trap" button or manually send a matching trap from the terminal.' At the bottom, there are buttons for 'With selected', 'Delete', and 'Go'.

NXTI provides the following capabilities:

- View, Add, Edit, Copy, Delete, and Disable trap definitions.
- View and Delete received trap logs.
- Search and sort both trap definitions and received trap logs.
- Monitor the *snmpd* process.
- Locally test *snmptrapd/snmpd* functionality.

NOTE: The SNMP Trap interface is only accessible to Nagios admins. Non-admin users will not have access.

How to Use SNMP Traps with NXTI in Nagios XI 2024

How NXTI Works

NXTI utilizes the SNMPTT application that is provided with Nagios XI. This is how the operating system processes the received traps into useful data. If you have previously worked with the SNMPTT configuration files, then you will be aware that it can become quite complex. NXTI provides a simple way to add, edit or remove trap definitions to the SNMPTT configuration.

The default SNMPTT configuration file on your Nagios XI server is `/etc/snmp/snmptt.conf` and is where the non-NXTI trap configurations reside. NXTI utilizes the separate configuration file `snmptt.conf.nxti`. This file should never be edited manually as those changes will be lost. Whenever you add, edit or remove a trap in NXTI, `snmptt.conf.nxti` is updated automatically and the `snmptt` service is restarted.

The trap definitions created by NXTI adhere to the [SNMPTT configuration file format](#), hence this documentation will explain how the NXTI fields relate to the SNMPTT trap definitions in the configuration file.

Every trap that is defined in a SNMPTT configuration file begins with an *EVENT* line. This is how the incoming trap is matched with a trap definition. Below is an example:

```
EVENT NXTI_Event_1 NET-SNMP-EXAMPLES-  
MIB::netSnpExampleHeartbeatNotification "NXTI Test Event" Normal
```

If an incoming trap is matched against the OID in the *EVENT* line, then the *EXEC* line(s) defined are executed (along with the other optional features of SNMPTT). The *EXEC* lines are how incoming trap data is actioned.

The most basic functionality that NXTI provides is to store a received trap in the database. These traps can be queried at any time after they have been received. While this basic configuration does not provide you with notifications for the received traps, it does allow you to receive a broad range of trap data that you can analyze without generating unnecessary notifications. This data is added to the database with the following *EXEC* command (just a sample of the line is shown):

```
EXEC php /usr/local/nagiosxi/scripts/nxti.php --event_name="$N" ....
```

To receive notifications for received traps, you can use the **Passive Service Setup** component of the trap definition. This adds an *EXEC* command like the sample of the line is shown below:

```
EXEC /usr/local/bin/snmptraphandling.py "$aR" "SNMP Traps" ....
```

Furthermore, you can define additional *EXEC* commands. This allows you to take other required actions for the received trap. Here is an example where a line is appended to a text file:

How to Use SNMP Traps with NXTI in Nagios XI 2024

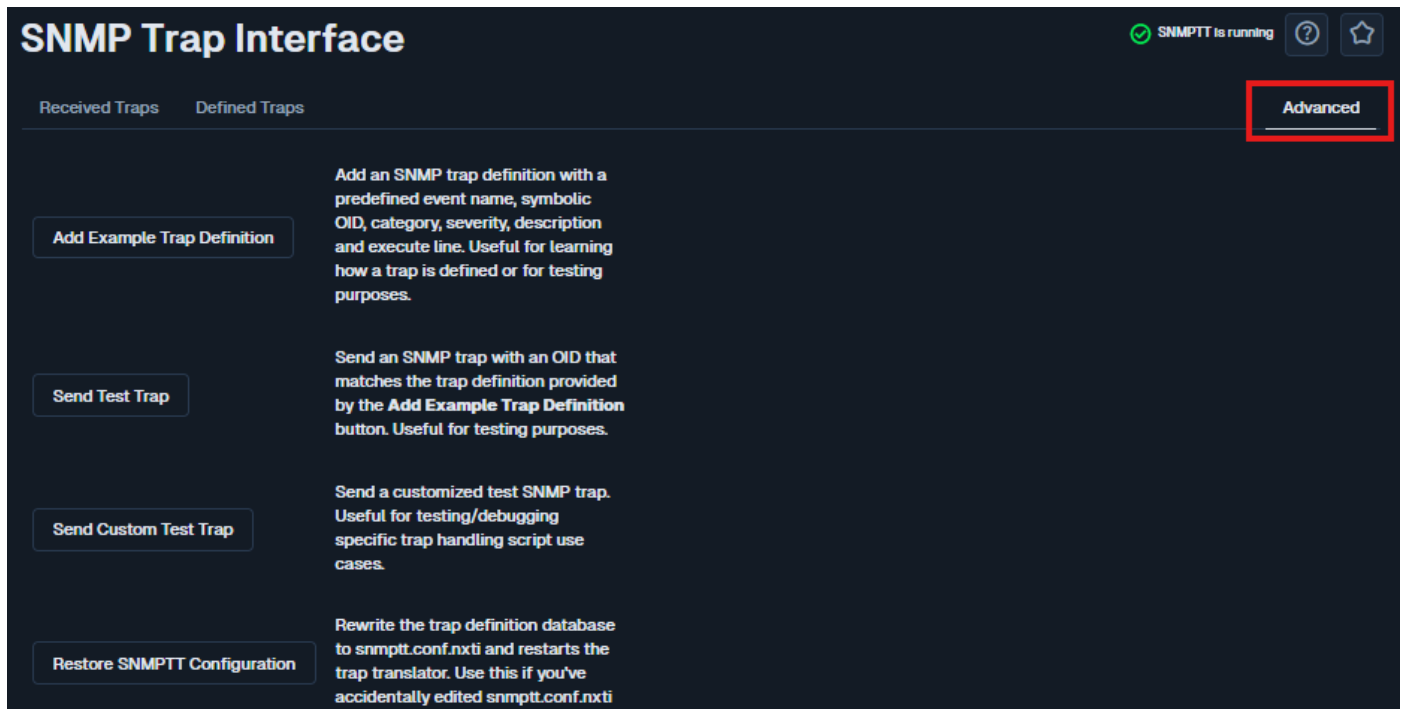

```
EXEC echo 'Success!' >> /usr/local/nagiosxi/var/NXTI_Write_Test
```

Finally, the advanced capabilities of SNMPTT can be defined such as PREEEXEC, NODES, MATCH, REGEX. These are outside the scope of this documentation, however, our [Nagios XI – SNMP Trap Tutorial](#) guide does explain how **MATCH** can be utilized in further detail.

Adding Trap Definitions

The **Defined Traps** tab allows you to create a trap definition and has many options available. For a beginner, these options can be overwhelming, and an example really helps learn how it works.

1. Click the **Advanced** tab which provides an **Add Example Trap Definition** button.

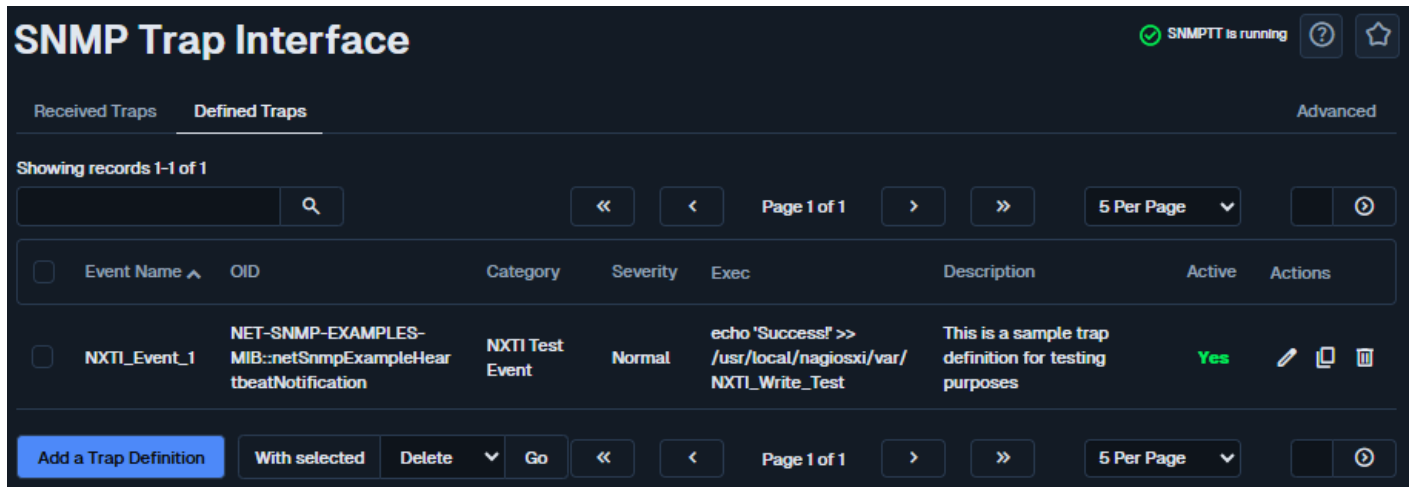

The screenshot shows the 'SNMP Trap Interface' with a dark theme. At the top right, there is a status indicator 'SNMPTT is running' with a green checkmark, a help icon, and a star icon. Below this, there are two tabs: 'Received Traps' and 'Defined Traps'. The 'Advanced' tab is selected and highlighted with a red box. Under the 'Advanced' tab, there are four buttons with descriptions:

- Add Example Trap Definition**: Add an SNMP trap definition with a predefined event name, symbolic OID, category, severity, description and execute line. Useful for learning how a trap is defined or for testing purposes.
- Send Test Trap**: Send an SNMP trap with an OID that matches the trap definition provided by the **Add Example Trap Definition** button. Useful for testing purposes.
- Send Custom Test Trap**: Send a customized test SNMP trap. Useful for testing/debugging specific trap handling script use cases.
- Restore SNMPTT Configuration**: Rewrite the trap definition database to `snmptt.conf.nxti` and restarts the trap translator. Use this if you've accidentally edited `snmptt.conf.nxti`.

2. Once you click the **Add Example Trap Definition** button, a message will appear at the top of the screen telling you it was added.
3. Click the **Defined Traps** tab again to see the newly added trap definition.

How to Use SNMP Traps with NXTI in Nagios XI 2024

The screenshot shows the 'SNMP Trap Interface' in Nagios XI. It has two tabs: 'Received Traps' and 'Defined Traps', with 'Defined Traps' selected. The interface shows a table with one trap definition. The table has columns for Event Name, OID, Category, Severity, Exec, Description, Active, and Actions. The trap is named 'NXTI_Event_1' with OID 'NET-SNMP-EXAMPLES-MIB::netSnpExampleHeartbeatNotification'. The description is 'This is a sample trap definition for testing purposes'. The 'Active' status is 'Yes'. The 'Exec' field contains the command: 'echo 'Success!' >> /usr/local/nagiosxi/var/NXTI_Write_Test'. There are also navigation buttons and a search bar at the top and bottom of the table.

Event Name	OID	Category	Severity	Exec	Description	Active	Actions
NXTI_Event_1	NET-SNMP-EXAMPLES-MIB::netSnpExampleHeartbeatNotification	NXTI Test Event	Normal	echo 'Success!' >> /usr/local/nagiosxi/var/NXTI_Write_Test	This is a sample trap definition for testing purposes	Yes	Edit Copy Delete

4. The trap that was added demonstrates how you can append some text to a file on the Nagios XI server when a heartbeat trap is received.
5. Click the **edit** icon in the **Actions** column to edit the trap. This opens the **Edit Trap Definition** page, which is almost identical to the **Add a Trap Definition** tab.

Here is that example trap definition as it exists in the `snmpd.conf.nxti` file.

```
EVENT NXTI_Event_1 NET-SNMP-EXAMPLES-
MIB::netSnpExampleHeartbeatNotification "NXTI Test Event" Normal
FORMAT Received trap "$N" with variables "$+*"
EXEC php /usr/local/nagiosxi/scripts/nxti.php --event_name="$N"
--event_oid="$i" --numeric_oid="$o" --symbolic_oid="$O" --community="$C"
--trap_hostname="$R" --trap_ip="$aR" --agent_hostname="$A"--agent_ip="$aA"
--category="$c" --severity="$s" --uptime="$T" --datetime="$x $X" --
bindings="$ $ +*"
EXEC echo 'Success!' >> /usr/local/nagiosxi/var/NXTI_Write_Test
SDESC
```

This is a sample trap definition for testing purposes

```
EDESC
```

There are four components to adding a trap definition:

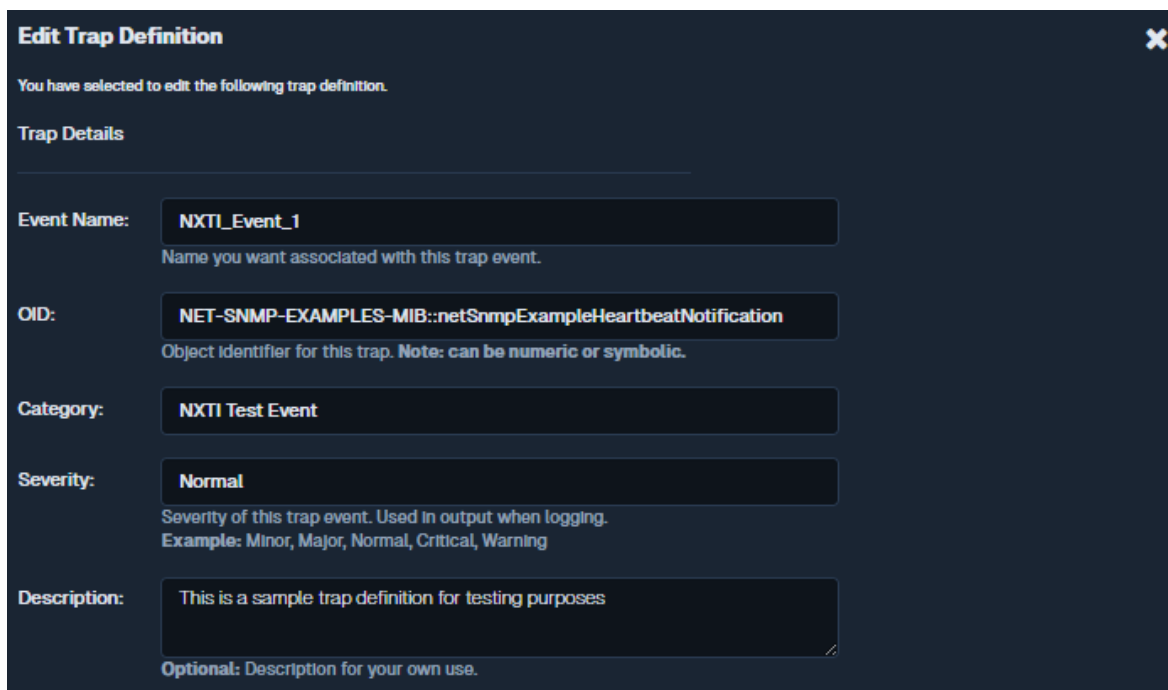

- [Trap Details](#): This is how a trap is identified and classified.
- [Passive Service Setup](#): Configure the trap so that Nagios XI can receive the trap data in a service.

How to Use SNMP Traps with NXTI in Nagios XI 2024

- [Exec](#): Defines commands to be executed when the trap is received.
- [Advanced](#): For the advanced capabilities of SNMPTT such as PREEEXEC, NODES, MATCH, REGEX.

Trap Details

The fields **Event Name**, **OID**, **Category** and **Severity** are specifically for the **EVENT** line in a trap definition and are required.

Edit Trap Definition ✕

You have selected to edit the following trap definition.

Trap Details

Event Name:
Name you want associated with this trap event.

OID:
Object Identifier for this trap. **Note: can be numeric or symbolic.**

Category:

Severity:
Severity of this trap event. Used in output when logging.
Example: Minor, Major, Normal, Critical, Warning

Description:
Optional: Description for your own use.

These directives are mandatory:

- Event Name
 - This must be a unique name that cannot contain spaces.
- OID
 - This is how an incoming trap is matched against this trap definition.
 - Can be either a full numeric OID or a symbolic OID.
 - Numeric OID is the raw (hard to read) format, for example:
 - .1.3.6.1.4.1.8072.2.3.0.1
 - Symbolic OID is an easy-to-read version of the numeric OID (case-sensitive).

How to Use SNMP Traps with NXTI in Nagios XI 2024

- You can define the fully qualified MIB name, for example:
 - iso.org.dod.internet.private.enterprises.netSnmp.netSnmpExamples.netSnmpExampleNotifications.netSnmpExampleNotificationPrefix.netSnmpExampleHeartbeatNotification
- You can also use a shorter variant, for example:
 - NET-SNMP-EXAMPLES-MIB::netSnmpExampleHeartbeatNotification
- Category
 - Allows you to categorize the incoming trap as per your requirements
 - Options like **IGNORE** and **LOGONLY** should be avoided ([see documentation](#)).
- Severity
 - Typically has a value from one of: "Minor", "Major", "Normal", "Critical", "Warning."
 - It cannot contain spaces.
 - This field value correlates to the Passive Service Setup severity option of **Pass Severity Level**.
- The **Description** field corresponds to the text between the *SDESC* and *EDESC* lines.
 - This is used to describe the conditions and handling of the event to technicians.
 - This can contain any text.
 - This is optional.

The screenshot shows the 'Passive Service Setup' configuration page in Nagios XI. At the top, it says 'Passive Service Setup' and 'These inputs will also work with the EXEC macro table.' Below this is a checkbox for 'Enable Passive Service Setup:'. The main configuration fields are: 'Host Name:' with the value '\$aR' and a tooltip 'The host name to associate with this event.'; 'Description:' with the value 'SNMP Traps' and a tooltip 'The service description of this event.'; 'Severity:' with a dropdown menu showing 'Parse Severity Level (\$s)'; and 'Output:' with the value 'SNMP Trap Received at \$@ with variables \$+*' and a tooltip 'The output that will be shown in Service Detail.'

How to Use SNMP Traps with NXTI in Nagios XI 2024

Passive Service Setup

This section is how you can configure this trap definition to send a passive check result to a Nagios service. The point of doing this is so that your Nagios XI users can receive notifications when traps are received for this trap.

1. Check the box to enable this functionality. You will also be required to populate each field.
2. The values already provided in each field are sufficient; however, click the placeholder icon to the right of the field to use it.

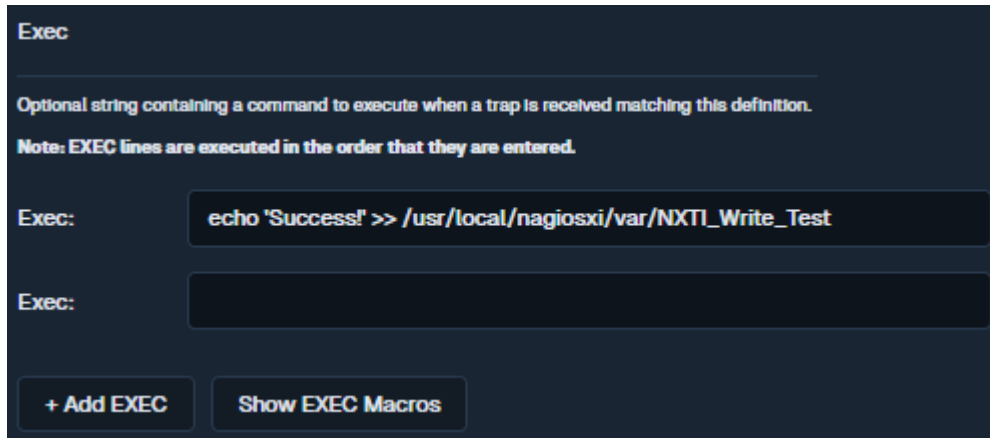

- a. The **Severity** selection designates what will be passed to Nagios as the state of the passive check result.
 - b. The **Pass Severity Level** option is commonly used as it does not hard code the state into the definition. This allows for advanced configurations where you have multiple trap definitions with identical OIDs but are using MATCH options to differentiate them. An example of this can be found in our [SNMP Trap Tutorial](#) article.
3. When you click **Enable Passive Service Setup**, an *EXEC* line is added to *snmptt.conf.nxti* for this definition.

Exec

Each Exec entry corresponds to an *EXEC* line. These are the commands that get executed by the *snmptt* process when each event occurs.

How to Use SNMP Traps with NXTI in Nagios XI 2024

1. By clicking the **Show EXEC Macros** button at the bottom of the Exec entry, you can see the list of macros that can be used (these are built into SNMPTT).
2. You can add as many *EXEC* lines as required, simply click the **+ Add EXEC** button to make another field appear. **Removing** an *EXEC* line is done by clearing the contents of the field.

Exec

Optional string containing a command to execute when a trap is received matching this definition.

Note: EXEC lines are executed in the order that they are entered.

Exec:

Exec:

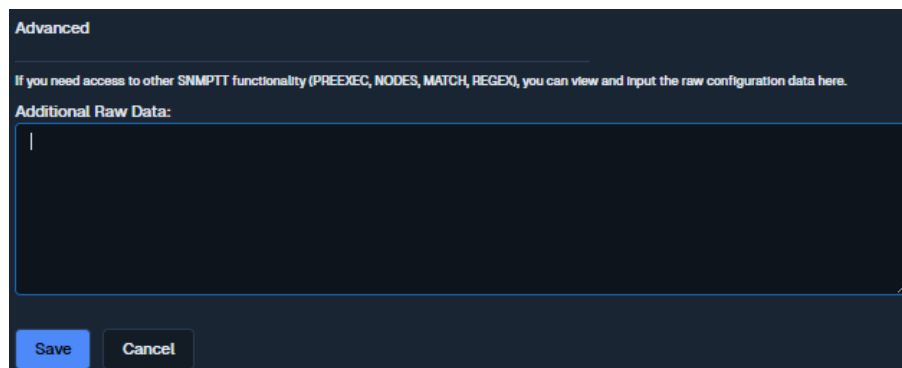

+ Add EXEC **Show EXEC Macros**

Advanced

The Advanced section allows you to use other features of SNMPTT such as PREEEXEC, NODES, MATCH, REGEX.

These are commonly used to manipulate the trap data received before the EXEC lines are executed. A detailed example using a MATCH can be found in our [SNMP Trap Tutorial](#) article.

1. Clicking the **Save** button will apply the changes to the `snmptt.conf.nxti` file and restart the `snmptt` service.
2. Clicking the **Cancel** button will discard any changes you have made.

Advanced

If you need access to other SNMPTT functionality (PREEEXEC, NODES, MATCH, REGEX), you can view and input the raw configuration data here.

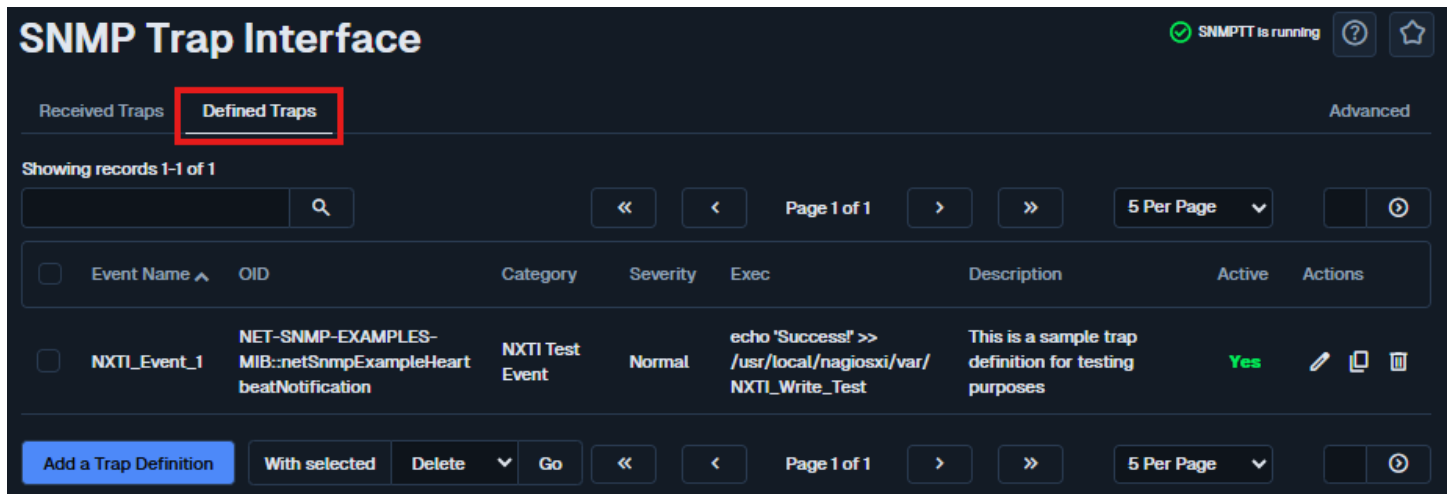

Additional Raw Data:

Save **Cancel**

How to Use SNMP Traps with NXTI in Nagios XI 2024

Managing Trap Definitions

The **Defined Traps** tab is how you manage your existing trap definitions.

SNMP Trap Interface SNMPPTT is running

Received Traps **Defined Traps** Advanced

Showing records 1-1 of 1

Search: [] [Q] [«] [<] Page 1 of 1 [>] [»] 5 Per Page [v] [🔍]

<input type="checkbox"/>	Event Name ^	OID	Category	Severity	Exec	Description	Active	Actions
<input type="checkbox"/>	NXTI_Event_1	NET-SNMP-EXAMPLES-MIB::netSnmpExampleHeartbeatNotification	NXTI Test Event	Normal	echo 'Success!' >> /usr/local/nagiosxi/var/NXTI_Write_Test	This is a sample trap definition for testing purposes	Yes	[✎] [📄] [🗑️]

[Add a Trap Definition] [With selected] [Delete] [v] [Go] [«] [<] Page 1 of 1 [>] [»] 5 Per Page [v] [🔍]

By default, only 5 traps are displayed per page. This can be changed by using the **Per Page** drop down list that appears on the right-hand side of the table (top and bottom).

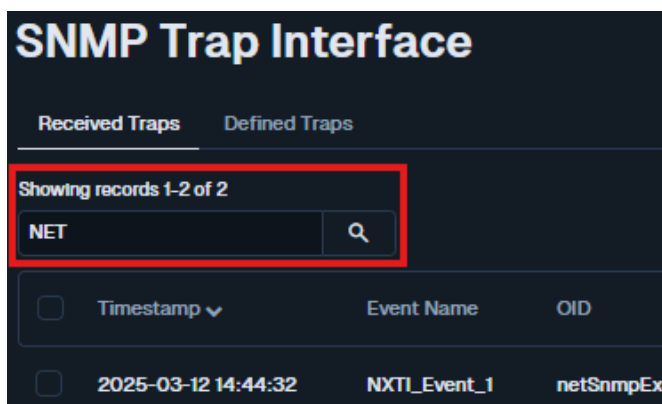

The buttons on either side of the page number count allow you to navigate back and forward through the pages.

You can jump to a specific page number by typing the number in the far-right field and clicking the **Jump to Page** button.

[«] [<] Page 1 of 1 [>] [»] 5 Per Page [v] [3] [🔍]

When you have many defined traps, you can use the search field to find what you are after, this searches the **Event Name**, **OID** and **Description** fields.

SNMP Trap Interface

Received Traps **Defined Traps**

Showing records 1-2 of 2

Search: [NET] [Q]

<input type="checkbox"/>	Timestamp v	Event Name	OID

How to Use SNMP Traps with NXTI in Nagios XI 2024

The columns headings can be clicked on to sort the trap definitions as per your requirements.

1. In the **Actions** column you can click the **edit**, **copy** or **delete** a trap by clicking the associated icons.
2. The **Active** column allows you to disable a trap definition without deleting it.
 - a. When it is enabled, click the **Yes** word to disable it. This will turn to a **No**.
 - b. To enable the trap again, click the **No** word.
3. You can **Delete**, **Enable** or **Disable** multiple trap definitions at once by using the left column field to select multiple traps and using the **With selected** drop down menu.

<input type="checkbox"/>	Timestamp	Event Name	OID	Trap Origin IP	Category	Severity	Actions
<input type="checkbox"/>	2025-03-12 14:44:32	NXTI_Event_1	netSnmpExampleHeartbeatNotification	127.0.0.1	NXTI Test Event	Normal	
<input type="checkbox"/>	2025-03-12 14:44:32	NXTI_Event_2	netSnmpExampleHeartbeatNotification	127.0.0.1	NXTI Test Event	Normal	

4. Click **Go** to perform the requested action.

Managing Received Traps

The **Received Traps** tab is where you can report on all received traps that have been defined.

The controls available on this page are almost identical to the **Defined Traps** tab. You can change the number of records per page, search the records and delete (one or many).

How to Use SNMP Traps with NXTI in Nagios XI 2024

Importing Trap Definitions

It's most likely that you will obtain a MIB file for your device that will include trap definitions. These can be imported into NXTI. There are several methods available for importing trap definitions into NXTI. We will explore each method in detail below.

Uploading A MIB File

You can upload a MIB file into Nagios XI via the **Admin > System Extensions > Manage MIBs** page.

The screenshot shows the Nagios XI interface for managing MIBs. The sidebar on the left includes 'Admin' and 'System Extensions' menus. The main content area is titled 'Manage MIBs' and includes a checkbox for 'Check this box if this server uses the SNMP Trap Interface' (checked), an 'Upload a MIB' section with a 'Browse...' button and 'Process traps' checkbox, and a table of installed MIBs. The table has columns for MIB, First Uploaded, Status, Date Processed, # Assoc Traps, and Actions. The table lists AGENTX-MIB, BRIDGE-MIB, DISMAN-EVENT-MIB, and DISMAN-SCHEDULE-MIB, all with a status of 'Unknown (Missing Database Entry)'.

1. First, use the **Browse** button to locate a MIB file you have downloaded, select it in your files, and click **Upload MIB** button.
2. Once complete you can navigate to NXTI and locate the newly imported MIBs.

XI lets you choose between two systems for handling traps.

- Built-in SNMP trap interface.
- Legacy trap handling system in XI.

NOTE: If you wish to use the legacy system, you will need to deselect the **Check this box if this server uses the SNMP Trap Interface** checkbox.

How to Use SNMP Traps with NXTI in Nagios XI 2024

Process Individual Traps

You can process an individual trap by checking the **Process traps** checkbox prior to uploading the MIB. If you forgot to select the box – don't worry, you can still process the trap by clicking on the **Process Traps** actions button (right blue arrow).

1. To see which traps have been processed on a MIB-by-MIB basis, click on the number, shown in the **# Assoc Traps** column.
2. To undo trap processing on a MIB-by-MIB basis, click on the **Undo Trap Processing** actions button.
3. You can download a MIB from your Nagios XI server to your workstation by clicking on the **Download** actions button (diskette icon).
4. You can also delete a MIB by clicking the **Delete** actions button (red X icon)

Process All Traps

You can process traps from all MIBs installed on your system by pressing the **Process All Traps** button.

This will process each MIB file in the `/usr/share/snmp/mibs` directory. If a trap exists it will import it into NXTI. Additionally, it will also double check the `/etc/snmp/snmpd.conf` file to see if the trap is already defined.

If it is defined, then it will comment it out of the `snmpd.conf` file so there is no duplicate definition.

1. You can see all the traps processed so far by clicking **View All Associated Traps**.
2. You can undo all the traps that have been processed by clicking **Undo All Trap Processing**.

Watch a video tutorial on how to upload and manage MIBs for SNMP in Nagios XI here:

<https://support.nagios.com/kb/article/nagios-xi-uploading-and-managing-mibs-852.html>

Import Existing Trap Definitions

Existing users of Nagios XI before the 5.5 release may already have traps configured in the `/etc/snmp/snmpd.conf` file. These can be imported into NXTI using a script which can save re-inventing the wheel.

After they are imported, the original `snmpd.conf` file needs to be truncated so there are no duplicate trap definitions. Follow these steps to import the `snmpd.conf` file into NXTI.

1. Establish a terminal session to your Nagios XI server as the root user. The first step is to change into the directory and create a backup of the `snmpd.conf` file by executing the following commands:

How to Use SNMP Traps with NXTI in Nagios XI 2024

```
cd /etc/snmp/  
cp snmptt.conf snmptt.conf.original
```

2. Now execute the following command to import the traps:

```
/usr/local/nagiosxi/scripts/nxti_import.php snmptt.conf
```

3. The script will output one line per trap it imports, here is some example output:

```
coldStart  
warmStart  
linkDown  
linkUp  
authenticationFailure
```

4. Now you need to truncate the *snmptt.conf* file by executing the following command:

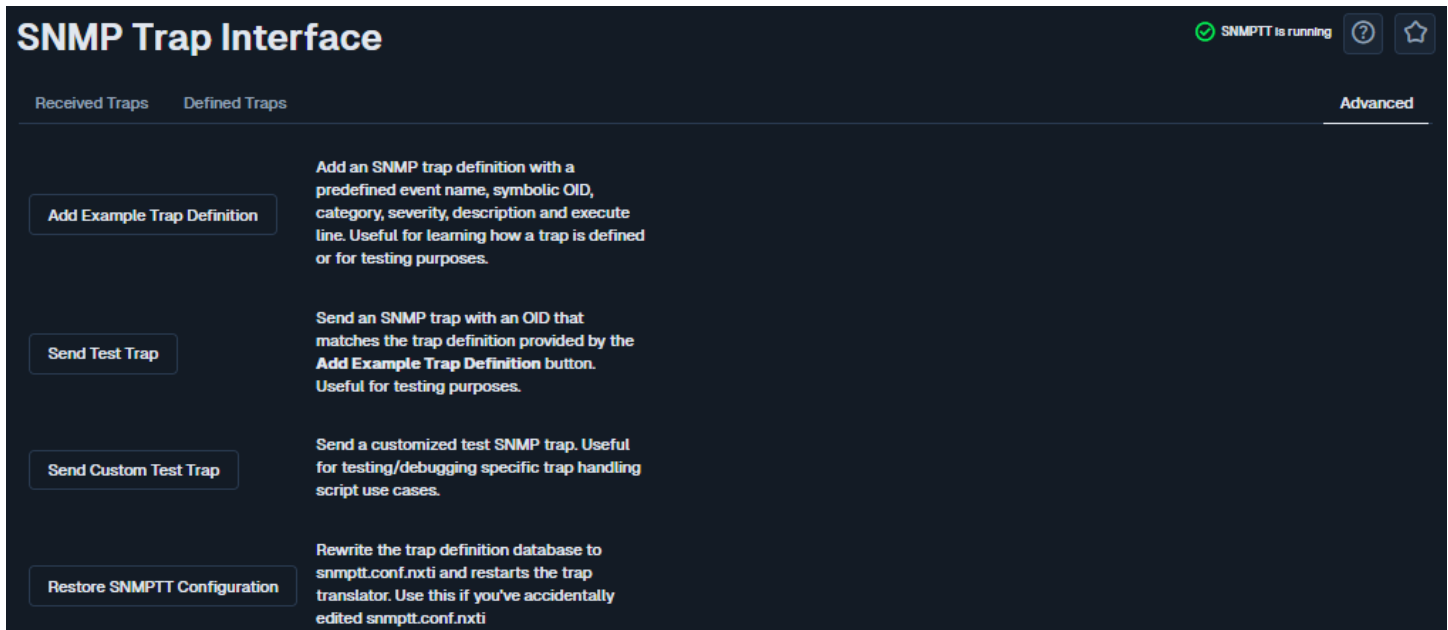

```
echo '' > snmptt.conf
```

5. You can close the terminal session as you have completed this part of the import. Next you need to open NXTI and check to make sure the traps have been imported; you'll find these under the **Defined Traps** tab.
6. The final step is to force the NXTI defined traps into the *snmptt.conf.nxti* file and restart the *snmptt* service. Both steps are performed by navigating to the **Advanced** tab and clicking the **Restore SNMP TT Configuration** button.

After completing these steps, you will have successfully imported the existing traps in the *snmptt.conf* file into NXTI.

How to Use SNMP Traps with NXTI in Nagios XI 2024

Advanced Features

The **Advanced** tab in NXTI provides various functionalities as explained below.

- **Once Click Systems Test**
 - Performs a complete test of your local SNMPTT setup. It will add a trap definition, verify its existence in the database, send a matching `snmptrap` command, verify that the trap was received, check the output of the `EXEC` line, and then delete the definition, trap log, and output file.
- **Add Example Trap Definition**
 - Add an SNMP trap definition that is useful for learning or testing.
- **Send Test Trap**
 - Allows you to send a trap that matches the example trap definition above.
- **Send Custom Test Trap**
 - Allows you to send a custom test trap, a modal window appears with fields you can populate.
- **Restore SNMPTT Configuration**
 - Pushes the settings from the NXTI configuration database back into the `/etc/snmp/snmptt.conf.nxti` file, useful if the file was accidentally edited.

How to Use SNMP Traps with NXTI in Nagios XI 2024

- Show Test File Contents
 - Displays a modal window with the contents of the `/usr/local/nagiosxi/var/NXTI_Write_Test` file.
- Show Unknown Trap Log
 - Displays a modal window with the contents of the `/var/log/snmpd/snmpdunknown.log` file.
 - This file can be useful for identifying received traps that yet do not have trap definitions created.

Finishing Up

This completes the documentation on **How to Use SNMP Traps with NXTI in Nagios XI**. If you have additional questions or other support-related questions, please visit us at our Nagios Support Forum, Nagios Knowledge Base, or Nagios Library:
