

How to Send SNMP Traps in Nagios XI

Purpose

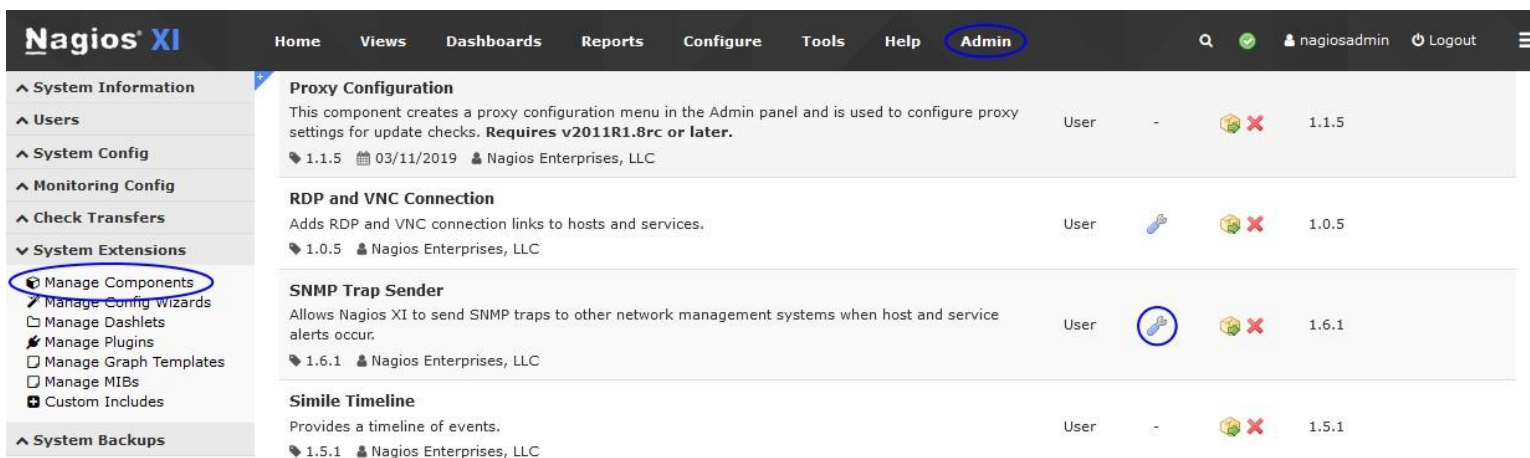

This document describes how to configure Nagios XI to send SNMP Traps to other management hosts or network management systems whenever host or service state changes (alerts) occur.

Target Audience

This document is intended for use by Nagios XI Administrators.

Configuring SNMP Traps

To configure Outbound SNMP traps navigate to **Admin > System Extensions > Manage Components**.

The screenshot shows the Nagios XI Admin interface. The 'Admin' menu item is circled in blue. In the left sidebar, 'Manage Components' is also circled in blue. The main content area displays a list of system extensions. The 'SNMP Trap Sender' component is highlighted with a blue circle around its 'Edit Settings' icon (a wrench and screwdriver).

Component Name	Description	User	Settings	Status	Version
Proxy Configuration	This component creates a proxy configuration menu in the Admin panel and is used to configure proxy settings for update checks. Requires v2011R1.8rc or later.	User	-	🚫	1.1.5
RDP and VNC Connection	Adds RDP and VNC connection links to hosts and services.	User	🔧	🚫	1.0.5
SNMP Trap Sender	Allows Nagios XI to send SNMP traps to other network management systems when host and service alerts occur.	User	🔧	🚫	1.6.1
Simile Timeline	Provides a timeline of events.	User	-	🚫	1.5.1

Click the **Edit Settings**  icon for the **SNMP Trap Sender** component.

The SNMP trap sender component configuration screen allows you to define trap hosts that Nagios XI should send SNMP traps to when host and service changes (alerts) occur.

Integration Settings

Check the **Enable SNMP trap sender integration checkbox** to enable this component.

Check the **Enable Debug Loggings** to enable advanced logging for this component.

How to Send SNMP Traps in Nagios XI

SNMP Trap Sender

Integration Settings

Enable SNMP trap sender integration

Enable Debug Logging

This will log traps sent to `/usr/local/nagiosxi/var/components/snmptrapsender.log`

Trap Hosts

Specify the addresses of the hosts that SNMP traps should be sent to. If you want to prevent traps from being sent during downtime check the checkbox. If you leave the Port field blank it will use the default port 162 and UDP protocol. Select the checkbox to use the TCP protocol.

Host Address	Port	Use TCP	Hosts	Services	State Type	Don't Send During Downtime	SNMP Version	Community
<input type="text" value="10.25.5.187"/>	<input type="text"/>	<input type="checkbox"/>	ALL <input type="button" value="v"/>	ALL <input type="button" value="v"/>	BOTH <input type="button" value="v"/>	<input type="checkbox"/>	2c <input type="button" value="v"/>	public
<input type="text" value="10.25.5.188"/>	<input type="text"/>	<input type="checkbox"/>	ALL <input type="button" value="v"/>	ALL <input type="button" value="v"/>	BOTH <input type="button" value="v"/>	<input type="checkbox"/>	3 <input type="button" value="v"/>	

MIBs

You should install the following MIBs on the trap management hosts:

[NAGIOS-NOTIFY-MIB.txt](#)

[NAGIOS-ROOT-MIB.txt](#)

Apply Settings

Cancel

The setting span to the right due to the amount of available options for v3.

SNMP Version	Community	Security Level	Username	Auth Password	Privacy Password	Engine ID	Auth Protocol	Priv Protocol
2c <input type="button" value="v"/>	public	noAuthNoPriv <input type="button" value="v"/>					None <input type="button" value="v"/>	None <input type="button" value="v"/>
3 <input type="button" value="v"/>		authPriv <input type="button" value="v"/>	trapuser	authpass	privpass	0x0102030405	SHA <input type="button" value="v"/>	AES <input type="button" value="v"/>

Trap Hosts

The first required field is **Host Address** order to send SNMP traps to a host. If the Port field is left blank then it will default to **162 UDP**.

How to Send SNMP Traps in Nagios XI

SNMP v1 & v2c require an **SNMP Community** string to be defined for a valid configuration.

SNMP v3 has a number of options available, they amount required depend on the **Security Level** chosen.

SNMP v3 configuration is not explained here, instead please refer to the following KB article: [Nagios XI - SNMP Trap v3 Configuration](#)

In the screenshot on the previous page you can see that if you select SNMP v1 & v2 the v3 options are grayed out and vice versa.

MIBs

There are two MIB files that can be downloaded. You can upload these files to the system that is receiving the SNMP Traps being sent from Nagios XI.

When finished, click the **Apply Settings** button to save your settings.

This is the extent of the configuration options available for the SNMP Trap Sender component.

Verifying SNMP Traps

There are a couple of ways to verify that the SNMP traps are being sent and received.

The Sender - Nagios XI Server

You can watch the `/usr/local/nagiosxi/var/eventman.log` file to see the events and `snmptrap` commands. For example:

```
tail -f /usr/local/nagiosxi/var/eventman.log
```

How to Send SNMP Traps in Nagios XI

Which will output something like:

```
PROCESSING:
```

```
Array
```

```
( [address] => 10.25.5.2
```

```
  [port] =>
```

```
  [community] => public
```

```
  [hoststateid] => 0
```

```
  [servicestateid] => 0
```

```
  [statetype] => BOTH
```

```
)
```

```
RUNNING COMMAND: /usr/bin/snmptrap -v 2c -c public 10.25.5.2 " NAGIOS-NOTIFY-
```

```
MIB::nSvcEvent nSvcHostname s "10.25.14.3" nSvcDesc s "Application Log Warnings" nSvcStateID 1  
3 nSvcOutput s "UNKNOWN - The WMI query had problems. The target host (10.25.14.3) might not  
be reachable over the network. Is it down? Looks like a valid name/IP Address. 10.25.14.3 is  
probably not even pingable. Wmic error text on the next line."
```

The Receiver

The device that is receiving the SNMP Traps should have some functionality to watch the incoming SNMP traffic.

In this example the receiving device was a CentOS server running **SNMPTRAPD** and **SNMPPTT**. You can watch the `/var/log/snmpptt.log` and `/var/log/snmppttunknown.log` files to see the incoming traps. For example:

```
tail -f /var/log/snmpptt/snmpptt.log /var/log/snmpptt/snmppttunknown.log
```

How to Send SNMP Traps in Nagios XI

Which will output something like:

Fri Dec 16 11:02:47 2016: Unknown trap (.1.3.6.1.4.1.20006.1.7) received from xi-c6x-x86 at:
